[Several factors have been identified as contributors to this high population growth, among them, high fertility rates, high levels of immigration to the United States, and the relatively young population (Brindis 1992, USCB 2002). Among Latinos, persons of Mexican origin form the largest population group, accounting for approximately 59% of the Latino population in the U.S.; Puerto Ricans place at a distant second, with approximately 10% of the population. The last decade has seen a marked increase in populations from Central and South America, which now account for approximately 3.5% of the total U.S. Latino population (USCB 2002).

[Overall, U.S. Latinos are a relatively young population, with a median age of 25.9 years compared to 35.3 years for non-Latinos. While 26% of non-Latinos are below the age of 18, 35% of Hispanics are found in that age group (USCB 2002). Among U.S. ethnic groups, only Native Americans have a younger population. Table 4 shows the mean age for each of the Latino groups in the U.S. (USCB 2002).

**Table 3**

#### **U.S. Population Distribution 1990-2000**

	1990	2002
Whites	80.3%	75.1%
African-Americans	12.1	12.3
Hispanics/Latinos	9.0	12.5
Asian/Pacific Islander	2.9	3.7
Native Americans	1.1	1.1
Others	3.9	5.5

\*The terms "Latino" and "Hispanic" are used interchangeably in this section to describe a heterogeneous group of people representing a kaleidoscope of experiences, educational attainment, acculturation levels, and citizenship status. The term "Latina" pertains specifically to Hispanic women.

[While the following material describes relevant sexual concepts among Latinos in the U.S., it cannot report all sexual-related knowledge and practices among this rapidly increasing heterogeneous population group. The following paragraphs, however, will highlight relevant sexual issues and hopefully dispel some of the stereotypes related to Latino sexuality. Comparisons presented here represent general data for Latinos; thus, the reader needs to keep in mind that there are differences among first-generation and other-generation Latinos, by age group, by economic level, and by acculturation level. The truth is that the variety of sexual practices and patterns among Latinos in the United States, and for that matter in Latin America, are only surpassed by the limits of human imagination.

*[Family Issues.* The majority of Latinos in the U.S. do not define their *familia* (family) in terms of the traditional nuclear-family concept accepted by mainstream America. It is, therefore, not uncommon for Latinos to reside in multi-generational households with members of their extended family (Alberda & Tilly 1992; Garcia 1993). This arrangement permits the division of labor, sharing of economic and domestic responsibilities, and most importantly, allows extended family members to participate in the rearing of children (Kutsche 1983; Leaper-Campbell 1996). The strong identification with the extended family explains the *apegamiento* (unity) traditionally ascribed to Latinos, highlights an individual's willingness to place the *familia*'s need before his or her own, and elucidates the role grandparents, as well as uncles and aunts, play in shaping Latinos' earlier views on sexuality (Brindis 1997).

[The Latino culture has been erroneously depicted as being patriarchal in nature. This impression, carefully maintained through the male's role as the family's representative before society, hides the decision-making role Latinas have in the family unit. In fact, Latinas are the base of the family structure, are the primary caregivers in the home, and have important nonpublic and nonverbal authority within the family (de la Vega 1990). In short, Latinas maintain the equilibrium and smoothness of family relationships. Similarly, realities associated with immigration have increased the number of Latina heads of household who support and maintain their families, in many cases without the direct intervention of any males.

[On the other hand, Latinas in their caregiving role, traditionally tend to pay more attention to the family's needs than their own. This expectation is most often noted in young women taking care of older relatives, while their male counterparts seek to forge their own future, albeit not too far from the family unit. Furthermore, traditional Latino families may also discourage young Latinas to pursue higher education and, instead, may seek to prepare them for marriage.

[Along with family orientation, Latinos often show the closely related concept of *simpatía*. The latter refers to Latinos' willingness to go along with items that may not be understood or that they may disagree with. Szapocznik (1995) has suggested that familism and *simpatía* may now be liabilities for Latinos in the United States, particularly for gay men who attempt to conceal their true HIV-status from their families and friends.

[Several authors (de la Vega 1990; Lifshitz 1990; Fennelly 1988) have emphasized the importance of recognizing the differences in family and cultural expectations regarding sexual behavior for females and males in the Latino culture. The acknowledgment of these differences assists in the understanding of the complexity of sexuality-related issues within this population group. This is particu-

larly true as we view Latinos in the U.S. through the prism of acculturation.

*[Sexological Concepts: Acculturation and Sexual Practices.* Among Latinos, sexual matters are considered to be private affairs not to be discussed in public. Therefore, it is not surprising that some Latinos have little understanding of their bodies, the sexual response cycle, and may still view sexuality exclusively within the context of procreation.

[Sexuality is an important life element among Latinos and is as complex as the heterogeneity of the population group. Latino sexuality is not limited or circumscribed to coital activity, but it is rather expressed through a variety of life attitudes which reinforce male and female sexual identities and roles. Sexual tones are evident in music, art, and dress codes, which emphasize the role of sexuality while avoiding offending community etiquette and expectations. *Coquetería* (to be discussed later) and *modestia* are opposing forces that characterize a woman's ability to openly pursue her sexuality while maintaining clearly delineated boundaries. In the United States, sexual patterns are not only affected by culture, but also by the individual's degree of acculturation and assimilation (Spector 1991).

[Acculturation and education also play a pivotal role in the acceptance of new expressions of sexuality. In a 1990 study, Marín, Marín, and Juárez found that Latinas with higher levels of acculturation reported more multiple sexual partners than those with lower acculturation levels. The same study found that less-acculturated males were more likely to carry condoms and report fewer sexual partners. A follow-up study found that less-acculturated Latinas were less likely to carry condoms and experienced higher levels of sexual discomfort (Marín, Gomez, & Hearst 1993). More-acculturated and educated Latinas are also more likely to adopt a leading role during heterosexual activities. Acculturation notwithstanding, sexuality continues to be a taboo topic for many Latinos, particularly for older, Spanish-speaking Latinos.

[Until the advent of the AIDS epidemic, few researchers had systematically documented sexual practices and knowledge among Latinos. Inappropriate application of methodological tools, language difficulties, and cultural insensitivity have all been identified as barriers to data collection among U.S. Latinos (Ford & Norris 1991). The lack of data about Latinos has been further exacerbated by the lack of identification of Latinos as a specific population group, particularly in large federally funded studies.

*[Sexual Stereotypes.* It is perhaps significant that general knowledge of Latino sexuality is denoted more by stereotypes than factual information. De la Vega (1990) concluded that numerous myths and stereotypes are found among Latinos, as within any group of individuals. It is important that these subtle cultural forms of differentiation not be missed by North American service providers, as they may be the nuances that allow for the development of educational strategies that will effectively reach the Latino population.

[Perhaps the most widely accepted stereotype for Latino males is that of the proverbially promiscuous "Don Juan." This eternally charming individual is known for his ability to sexually conquer and satisfy a large number of females. "Don Juan" characterizes the expectation that Latino men acquire sexual knowledge as a result of their early onset of sexual activity (Blasini-Caceres & Cook 1997).

[A second stereotype deals with the submissive, passive, and docile feminine nature of Latinas in sexuality matters. Traditional cultural expectations dictate that a woman refrain from sexual activity until marriage, thereby, limiting

her ability to acquire knowledge. The submissive nature of Latinas is highly contrasted with the expectation that they be erotic, creative, and pleasing in sexuality-related matters. This dichotomy is evident in the seemingly contradicting popular advice provided to young Latinas by elder relatives that they need to be a “*señora en la casa, una dama en la mesa, y una puta en la cama*” (a lady in the house and a whore in bed).

[A third stereotype among Latino males is that they are always ready and willing to engage in sexual activity. This stereotype may lead to the conclusion that, on the whole, Latino males are more likely to force their sexual needs on unwilling partners. This stereotype does not seem to be supported in the professional literature. Finally, anecdotal and empirical evidence seem to suggest differing expectations based on acculturation levels. In fact, more-conservative norms may be found among more-educated Latinos.

[*Gender and Gender Roles.* Worth and Rodriguez (1987) reported that despite the fact some Latinos in the United States have nontraditional lifestyles, they continue to adhere to traditional gender roles. Fennelly (1992) reported on cultural double standards and suggested that, whereas males are encouraged to develop strong self-reliant identities and explore their sexuality, females are taught the value of *etiqueta*, or proper and expected forms of feminine sexual behavior. These, sometimes-conflicting cultural norms contribute to what has been called the “cult of virginity” (Garcia 1980).

[This “cult of virginity” has its roots in the Catholic Church’s teachings and is seen as a sign of purity for women. The basic premise of virginity until marriage has been found to decrease a number of sexual health problems, such as unplanned pregnancies, and to decrease the number of STDs. The primary problem with this concept, at least as practiced among Latinos, is that it is not applied equally to both genders. The literature suggests that these double standards result in either females postponing sexual activities, underreporting of sexual contacts (Taggart 1992), and in some cases, denial of other sexual behaviors, such as anal sex, which are engaged in to preserve the “cult of virginity” basic premises. This, however, does not prevent sexual innuendo from taking place.

[*Coqueteria* is a term used to describe a group of female behaviors aimed at reinforcing sexual attraction. Some of these behaviors include the use of sexually appealing clothing, the adoption of manners that stimulate sexual attraction, and the use of verbiage that indicate sexual interest. Latinas are not the only ones to discreetly express their sexual or personal interests. *Piropos* are statements generally expressed by men that include a sexual connotation within the context of respect and value for females. Cultural sexual standards are also denoted in language which arbitrarily classifies females as either suitable for marriage, *novias*, or those who can be pursued for sexual conquests, *amantes* (Alexander 1992; Carballo-Diéguez 1989). This dichotomy of sexual and gender roles may explain the reason sexual discussions seldom take place among spouses, since *esposas* (wives) are expected to possess little knowledge about their own sexuality, and even less about their spouse’s. It has been suggested that, in some cases, the only Latinas totally in charge of their own sexuality are commercial sex workers, as they can be less constricted to express and fully explore their sexuality.

[De la Vega (1990) suggested that sexual double standards are based on the erroneous belief that males are less able than females to control themselves sexually. It is believed that women exercise greater control over their sexual impulses, while males appear to be guided by their instincts. In this context, male infidelity is more easily tolerated than

female infidelity. Research indicates that Latinos who have poor sexual communication skills engage in extramarital affairs more often than those who have fewer difficulties communicating with their sexual partners. A 1994 study found that infidelity rates were higher among those who attended church infrequently than regular church attenders (Choi, Catalnia, & Docini 1994).

[*Machismo and Marianismo.* *Machismo* has been described as a strong force in most Latino communities, which encourages males to be sexually dominant and the primary providers for their families; it stresses male physical aggression, high risk-taking, breaking rules, and casual, uninvolved sexual relations (de la Vega 1990). In contrast, *Marianismo* refers to Latino cultural expectations that include the spiritual and moral superiority of women, and encourage Latinas to be virginal, seductive, privately wise, publicly humble, fragile, and yet, provide the glue that holds the family together. It has been argued that while these standards lead to womanizing, they also foster the tenet among males that they are responsible for their family’s welfare. Low education and acculturation have been found to correlate with stronger *machismo* views among Latinos in the U.S.

[*Sexual Education.* The AIDS epidemic has spearheaded an emphasis on the need to investigate sexuality education and communication patterns among Latinos in the United States. Family bonds, moral values, *machismo*, *Marianismo*, *etiqueta*, as well as profound religious beliefs, combine to prevent U.S. Latinos from openly discussing sexuality with family members. In some cases, just saying sexual words in front of family members may be difficult for some Latinos (Medina 1987). The secrecy surrounding sexuality prevents Latinos from receiving adequate, if any, information about sexuality, contraceptives, and HIV/AIDS and other STDs (Amaro 1991; Carrier & Bolton 1991; Mays & Cochran 1988). In 1992, only 67% of Latinos said they had communicated with their children about AIDS, as compared to 77% of European-Americans and 74% of African-Americans (Schoenborn, Marsh, & Hardy 1994).

[In traditional Latino families, sexuality education may come from extended family members rather than nuclear-family members. Aunts, uncles, and grandparents may assume the role of sexuality educators for younger generations. For instance, Marín, Marín, and Juárez (1990) reported that Latinos were more willing than non-Hispanics to discuss certain sexual topics (i.e., drug use and sex) with an older family member.

[In a study of first-generation immigrant adolescents employed in agriculture, Pérez and Pinzón (1997) found that Latino parents failed to adequately educate their children about sexuality-related matters. However, not all Latino parents hesitate to address sexuality-related issues with their offspring. Some researchers have found that 57% of Latino parents do communicate with their children about sexuality. In those cases, home-based sexuality education is the primary responsibility of the mother (Biddlecom & Hardy 1991; Dawson & Hardy 1989).

[Latino heterogeneity is further supported by Durant (1990) who reported that Mexican-American females were less likely than non-Latinas to have communicated with their parents about contraception, sex, and pregnancy. Dawson (1990) found that Mexican-Americans were less likely to broach these topics with their children (50%) than were Puerto Ricans (74%) and other Latinos (64%). In those instances where parents educate their children about sexuality, the responsibility most often lies with the mother. Romo, Lefkowitz, and Sigman (2002) found that maternal mes-

sages, self-disclosure, and a nonjudgmental attitude played a key role in interactive conversations with their adolescents

[The data suggest that some Latino parents rely on the schools and, in some cases, mass media to educate their children about sexuality-related issues. In a 1994 study, Schoenborn, Marsh, and Hardy found that 46% of Latinos had received AIDS information through radio public service announcements (PSAs), compared to 36% of European-Americans and 44% of African-Americans.

[An additional 14% of Latinos said they had received information through store displays or brochures, compared to 7% of European-Americans and 12% of African-Americans. Marín, Marín, and Juárez (1990) concluded that this lack of sexual education may contribute to higher rates of childbearing among Latinos. This is among the greatest paradoxes encountered among Latinos, since research suggests that home-based sexuality education plays a key role in decreasing pregnancy rates among Latino adolescents (Brindis 1997) and increasing condom use (Moran & Corley 1991).

[*Contraception.* Throughout Latin America, the number of children in a household assists in establishing a male's role in the community. A large number of children, especially among low-income populations, are sometimes necessary for economic survival; the more hands available for work, the greater the family's income. It is, therefore, not surprising that contraceptive methods are skeptically viewed by some Latinos.

[Religion, condom use during first sexual experience (Marín, Marín, & Juárez 1990), sexual orientation (Rotheram-Borus et al. 1994), education, and income (Fennelly 1992) have been identified as being involved with attitudes and likelihood of using contraceptives among Latinos in the U.S. In a survey of urban adolescents, Sonenstein, Pleck, and Ku (1989) found that Latino males have more-negative attitudes towards condom use than their non-Hispanic counterparts. In a study of 131 bisexual youths in New York City, Rotheram-Borus and colleagues (1994) found that males were more likely to use condoms with a male than with a female sexual partner.

[Contraceptive use is further compounded by the fact that contraception among Latinos is primarily the responsibility of the woman, who may not have the ability to promote safer-sex practices, including the use of barrier methods, with their sexual partners (Mikawa 1992; Norris & Ford 1992; Marín, Marín, & Juárez 1990). Latino women were less likely to use condoms if their sexual partners opposed condom use than were Latinas whose partners did not oppose them or voiced no opinion. Males' unwillingness to utilize condoms may place their partners at risk for unwanted pregnancies and sexually transmitted diseases. Other studies have found that Latino males are less likely to use condoms with their spouses, or their primary partners, than with other sexual partners (Pérez & Fennelly 1996; Sandoval et al. 1995). Jemmott, Jemmott, and Villarruel (2002) found that Latino college students were more likely to use condoms if they perceived partner and/or peer approval and perceived themselves capable of using the condoms. Similarly, condom use among Latinas has been related to their partners' willingness to use condoms and women's fears about their partners having multiple sexual partners (Flaskerud, Uman, Lara, Romero, & Taka 1996).

[The couple's acculturation and assimilation level, their adherence to Catholic Church doctrine, and their desire for large or small families also play a key role in their decision to use contraceptives (Marín, Marín, & Juárez 1990). The data indicate that more and more Latino men tend to share

the decision on whether or not to use contraceptives with their sexual partners.

[*Adolescents and Sexuality.* Latino youths in the United States balance conflicting messages from two cultures regarding their sexuality (Brindis 1992). While the dominant culture appears to promote high levels of nonmarital sexual activities, Latino youths, particularly females, must also deal with the more conservative Latino cultural norms towards sexuality and the "cult of virginity."

[Studies investigating sexual behaviors among Latino adolescents have yielded mixed results. Brindis (1992) found that coital activity rates for Latino youth fall somewhere between that of African-Americans and European-Americans. In contrast to self-reports of lower sexual-activity levels among Latino youth, a national survey found no differences among the proportion of Latino and non-Latino Anglo-American young men who engaged in sexual activities before age 13 (4% and 3%, respectively) (Sonenstein, Pleck, & Ku 1991). Similarly, Forrest and Sing (1990) found that among never-married females 15 to 19, 49% of Latinas reported being sexually active compared to 52% of European-Americans and 61% of African-Americans. Differences, however, have been found based on attitudes towards premarital sex (Ginson & Kempf 1990; Padilla & Baird 1991). The data suggest that among adolescents, Latino males tend to engage in sexual intercourse at an earlier age than do females (13 and 15 years of age, respectively). In cross-cultural comparisons, Latino adolescents have been found to have higher sexual risk-taking behaviors (i.e., unprotected sex) than their non-Latino counterparts (Brindis, Wolfe, McCater, Ball, et al. 1995). Brindis (1997) concluded that "acculturation is a key variable influencing adolescent attitudes, behavior, and knowledge about reproduction and contraception" (p. 8).

[Some very conservative families see teenage pregnancy, and in some cases, pregnancy before marriage, as a "failure." These views are expressed in the often-used phrase *fracazó la muchacha*. It is important to clarify that this "failure" does not represent a rejection of the newborn, but rather the woman's limitation to pursue educational goals, employment opportunities, and her possibilities for marriage. National data show that in the 1990s, the birthrate among Latina females age 15 to 19 has decreased by 12% compared to 19% for non-Hispanic whites (Moore et al. 2001).

[One of the pivotal stages in a Latino woman's life is the *quinceañera* celebration—an event that is analogous to the traditional "sweet sixteen" observed in North America. The *quinceañera* party marks a woman's transition to adulthood, including accessibility for marriage and childbearing. During this joyous time, the female is formally introduced to society and is recognized as having achieved full womanhood.

[Educational level and formal instruction play a role in parental willingness to discuss and educate their adolescent offspring about sexuality. Those with more education have been found to be more willing to educate their children about sexuality-related issues.

[*Adults and Sexuality.* There is a dearth of data related to the frequency and sexual preferences, masturbatory frequency and techniques, use of pornography, and sexual dysfunctions among Latinos in the United States. Latino males are more likely than non-Hispanic whites and African-Americans to indicate a greater level of physical satisfaction with their partner during the last 12 months in primary relationships (51%, 47%, and 43%, respectively). Conversely, Latinas are less likely (39%) than non-Hispanic whites

(40%) and African-Americans (44%) to report the same level of satisfaction with their sexual partners (Laumann et al. 1994). Not surprisingly, 96% of Latino men reported always or usually having an orgasm with their partners during the year preceding the *National Health and Social Life Survey (NHLS)*, compared to 68% of Latinas.

[Sexual discussions among Latino men tend to occur within same-gender groups while they are under the influence of alcohol, with sex-industry workers, and in the context of jokes (Carrier & Magaña 1991; de la Vega 1990; Hu & Keller 1989). In a national survey of sexual behaviors, Billy, Tanfer, Grady, and Klepinger (1992) found that Latino men reported a median of 6.1 sexual partners over a lifetime as compared to 8.0 for African-Americans and 6.4 for non-Latino white males. The same study found that Latinos were more likely than non-Latinos to report four or more sexual partners in the last 18 months. In a survey of over 1,500 Latinos, Marín, Gomez, and Hearst (1993) found that 60% of single Latino males reported multiple sexual partners in the previous 12 months.

[Although dialogs about sexual issues are often avoided, Latinos have other more socially acceptable forms to express their sensuality and sexual desire. Some of these mediums include music, dance, art, and poetry. Research indicates that Latino males learn about their sexuality through practical experience rather than through sexual education. Anecdotes suggest that it is not uncommon for young Latinos to lose their virginity through an experience with a sex-industry worker, usually encouraged by older relatives, in what could be termed a "sexual rite of passage."

[Data from the *NHLS* show that Latino males are more likely to engage in masturbation at least once a week than females (24.4% and 4.7%, respectively). The disparity in rates may indicate that Latinas are less likely to acknowledge engaging in this non-acceptable social behavior as perceived by the traditional Latino culture.

[Data from the *NHLS* show that Latinos, including women, are less likely than non-Hispanic whites, and more likely than African-Americans to report engaging in fellatio and cunnilingus. Latino males are more likely than females to report that they have performed oral sex (70.7% and 59.7%, respectively). Similarly, Latino males are also more likely than Latinas to report receiving oral sex (72.3% and 63.7%, respectively). Table 5 shows common sexual dysfunction problems by ethnic group in the United States.

[*Pregnancy*. Researchers have identified acculturation level, parental communication, low education, language, and country of origin as a determinant for pregnancy among Latino women (Durant 1990). Given the cultural significance of motherhood, it is not surprising that in the United States, Latinas experience more per-capita births than their non-Latina counterparts. In 1990, the average number of children per Latino family was 3.76 compared to 3.43 for African-Americans and 3.11 for European-Americans (USDC 1991).

Data from the 2000 census show that Latinas had an average of 2.5 births compared to 1.8 for non-Hispanic whites and Asian Pacific Islander women (USBC 2001). Brindis (1997) has suggested that the higher number of children among Latinas may be a residual effect of an intrinsic belief that developed among immigrants based on economic needs and high mortality rates in their countries of origin.

[Garcia (1980) suggested that motherhood serves to secure an identity for the Latino woman. In a 1991 survey, Segura found that the meaning of motherhood among Latinas differed, depending on their country of birth. In his study, Segura surveyed Mexican-born women and American-born Chicanas; the findings indicate that while Mexican-born women viewed motherhood as all-encompassing, Chicanas gave greater meaning to childrearing. Among Latinas, Puerto Rican females have the highest rate of pregnancies. Among Mexican women, those born in Mexico experience more pregnancies than those born in the U.S. (Aneshensel, Becerra, Fiedler, & Schuler 1990). Darabi and Ortiz (1987) concluded that "one plausible explanation of these findings could be that Mexican-origin women marry at very early ages" (p. 27). Further differences were reported by Fennelly (1992), who found birthrates among Latino adolescent females ranging from a high of 21% among Mexican-Americans to a low of 6% among Cuban mothers. Fennelly-Darabi and Ortiz (1987) reported that Latino women were more likely than non-Latino women to have a second birth shortly after the first, and were less likely to have positive attitudes towards abortions.

[Despite higher birthrates than other ethnic groups, lower socioeconomic backgrounds, and fewer prenatal visits to physicians, Latinas as a group have fewer low-birthweight babies. This finding has confused experts who would expect the opposite to be true based on socioeconomic factors. Several explanations have been offered, such as better nutrition in the form of complete proteins, less use of alcohol and other psychoactive drugs during pregnancy, and increased family support during the months preceding childbirth. Other researchers have attempted to link higher birthweights with religiosity and spirituality of Latinas in the United States (Magaña & Clark 1995).

[Latinas in the U.S. have also been found to have among the lowest abortion rates. In a study by Kaplan, Stewart, and Crane (2001), only 7.5% of the Latinas aged 14 to 24 had ever had an induced abortion.

[*Marriage*. Marriage is highly valued among Latino groups; however, in some cases, no difference is made between legal unions and long-term cohabitation. Fennelly-Darabi, Kandiah, and Ortiz (1989) reported that it is not possible to determine the number of couples in informal unions. In a later study, Landale and Fennelly (1992) reported that while the number of nonmarital unions has decreased on the island of Puerto Rico, they have greatly increased among Puerto Ricans living on the U.S. mainland.

**Table 5**  
**Sexual Dysfunctions by Ethnicity**

	Whites		African-Americans		Latinos		Asians	
	Males	Females	Males	Females	Males	Females	Males	Females
Lack interest in sex	14	29	19	44	13	30	24	42
Unable to achieve orgasm	7	24	9	32	9	22	19	34
Sex not pleasurable	7	21	16	32	8	20	9	23
Erection problems	10	N/A	13	N/A	5	N/A	12	N/A
Lubrication problems	N/A	22	N/A	15	N/A	12	N/A	17

Source: Laumann, Paik, and Rosen 1999

[According to the Census Bureau, in 1990 in the U.S., Latino marriage rates (62.3%) were almost the same as non-Latino whites (64%) and were higher than that of African-Americans (46.3%). By 1999, Census data showed a 68% marriage rate among Latinos, compared to 82% for non-Hispanic whites (USCB 1999).

[On the other hand, data of the National Council of la Raza indicate that “The number of Hispanic single parents has increased at a faster rate than Black or White female-headed families” (1993, 12). According to Brison and Casper (1998), 42% of Latino children are born to a single parent, compared to 58% of African-American children and 25% of non-Hispanic white children. Data from the 1999 *Current Population Survey* showed that Latino families were more likely than non-Latino whites to be headed by a female head of household without a spouse. Puerto Ricans were found in that study to be more likely to have a female head of household (see Table 6). According to the U.S. Census Bureau, in 1991, 60% of Latino families with a female head of household with children under 18 lived under the poverty line (USBC 1993).

[Fennelly, Kandiah, and Ortiz (1989, 96) argued that “A woman’s marital status at the time she bears a child is important because of the implications for her later fertility, and for her own and her children’s economic and social status.” The social and legal implications of out-of-wedlock births have then been used to explain the reasons why there are more premarital pregnancies than premarital births in the Latino culture. It has been a time-honored tradition among some Latinos to marry while the woman is pregnant, in order to provide a stable and legal union for the newborn.

[*Rape*. According to the U.S. Department of Justice, Bureau of Justice Statistics (2002), 750,000 Hispanic persons age 12 or older were victims of rape, sexual assault, aggravated assault, and simple assault during 2001. That figure represents an increase from 2000, when about 690,470 Hispanics were victims of rapes, sexual assaults, robberies, and aggravated and simple assaults. While federal statistics show low levels of sexual assault among Latinas, some researchers (Sorenson & Siegel 1992) have speculated that these low incidence rates are primarily because of underreporting by Latinas.

[Research findings seem to suggest that acculturation and gender, not culture, are key determinants of attitudes towards forcible sexual activities. In a study of attitudes towards date rape among college students, Fischer (1987) found that Latino students held more-traditional gender roles and had a more-positive attitude towards forcible intercourse under certain circumstances. These included spending a lot of money on the woman, the length of time they had dated, the female “leading” the man on, and the female’s previous sexual history. Acculturation and gender were also found to play a role in the views of college students towards forcible sexual encounters. According to Fischer (1987),

“Bicultural and bilingual Hispanic women are less rejecting of forcible rape than assimilated Hispanic and majority women are, while Hispanic males, regardless of degree of acculturation, are less rejecting of forcible date rape than are majority males” (p. 99).

[Lefley and colleagues (1993) reported that Latinos not only had different definitions of sexual coercion, but also were more likely to blame the victim than were their Anglo-American counterparts. A review of the literature did not support the notion of espousal rape. Males under the influence of alcohol may force their spouses to engage in sexual activities. Forcible sexual intercourse may not be perceived as a violation of a female’s body if it happens within the context of marriage. As a result, espousal-rape reports among Latinos in the U.S. are more likely to occur among the acculturated, assimilated second generation, and those with higher educational levels.

[*Same-Gender Sexual Activities*. In a study of African-American, Latino, Asian/Eurasian, and Caucasian gay adolescent males, Newman and Muzzonigro (1993) found that traditional families were less accepting of homosexuality than low-traditional families. Bonilla and Porter (1990) found that Latinos did not differ significantly from their African-American and white counterparts on attitudes toward homosexuality; however, they were less tolerant in their perceptions of civil liberties. This lack of acceptance may force males to hide their sexual orientation or to pursue heterosexual lifestyles (i.e., marriage) while secretly engaging in same-gender sexual activities.

[Family acceptance is only part of the equation explaining Latino views toward same-gender sexual activities. Same-gender sex has different meanings and connotations for Latinos than for the non-Latino population in the United States. As a general rule, same-gender relationships are heavily stigmatized among Latinos, even among highly acculturated groups (Fischer 1987). Homosexuality is not a topic easily discussed among males (Pérez & Fennelly 1996).

[Magaña and Carrier (1991) suggested that it is not totally uncommon for Latino males to turn to “effeminate” males to satisfy their sexual needs under certain conditions. They identified lack of a female sexual partner and/or lack the economic resources to visit a sex worker as an acceptable reason for male-male sexual activities. Same-gender sexual behaviors are also more likely to appear while under the influence of alcohol. Same-gender sexual activity perceptions are also affected by Latino cultural norms. Latinos do not necessarily classify the penile inserter during male-male anal sex as homosexual (Amaro 1991; Carrier 1976). As a result, Latino males engaging in same-gender sexual activities may not perceive themselves, or be perceived as, “homosexual” or “bisexual,” as long as they play the appropriate dominant sexual role—a role which tends to mirror that of the male in a heterosexual couple (CDC 1993). Carrier (1976) reported that unlike their American “gay” counterparts, Mexican males engaging in same-gender sex prefer anal intercourse over fellatio or other forms of sexual gratification. Also, in contrast to their Anglo-American counterparts, Latino males are more likely to assume only the passive or receptive role during same-gender encounters. Ross, Paulsen, and Stalstrom (1988) concluded that it is not the sexual act itself, but rather the cross-gender behavior which gets labeled and heavily stigmatized among Latinos.

[The lack of identification with the homosexual community may explain the inability of Latino men who engage in sex with other men to identify or respond to educational programs targeting homosexuals. But, most importantly, it

**Table 6**

**Family Households by Hispanic Origin**

	Married Couple	Male Householder —no spouse present	Female Householder —no spouse present
Mexican	70%	9%	21%
Puerto Rican	57	6	37
Cuban	79	4	17
Central & South American	67	10	24

Source: USCB 1999

emphasizes the need for researchers to concentrate more on behaviors than labels when studying sexual interactions (Alcalay et al. 1990; Carrier & Magaña 1991). The labeling-versus-behavior distinction is important in light of the fact that 45% of AIDS cases among Latinos are the result of same-gender sex, and that an additional 7% of AIDS cases are related to same-gender sex with intravenous drug users (CDC 1994). (For additional discussion of HIV/AIDS and Latinos, see section 10B, Sexually Transmitted Diseases and HIV/AIDS, below.)

[Acculturation plays a major role in Latino participation in same-gender sexual activity. According to Greene (1994), same-gender male sexual activity may be prompted by the "Cult of Virginity," since a Latino male may not be able to find a female sexual partner.

[In the Latino culture, female-female sexual activity is even more stigmatized than male-to-male sexual activity. This rejection can be explained by what Trujillo (1991) labeled a threat to the traditional male dominance. The lack of acceptance may also be explained by the fact that female-to-female sexual contact dispels the myth of Latinas being submissive and not well versed in sexuality-related matters.

[*Bisexuality.* De la Vega (1990) discussed three bisexual patterns among Latino men in the United States. The first type he labeled the closeted, self-identified, homosexual Latino. He described this type as a male with homosexual tendencies, but who lives a heterosexual lifestyle. The second type discussed by de la Vega, is the closeted, latent-homosexual Latino; this type is characterized by a male who describes himself as a heterosexual, but who engages in same-gender sex while under the influence of mind-altering substances, primarily alcohol. Finally, de la Vega described the "super-macho" heterosexual Latino. This man allows himself to have sexual contacts with other males, since he considers them to be "pseudo-females." This last type of male will not admit, even to himself, that he may express homosexual tendencies.

[*Summary.* Latinos in the United States represent a wide range of educational attainment, socioeconomic levels, and skin color. Sexual practices and knowledge among this population have been found to be heavily influenced by strict cultural norms largely shaped by the Catholic Church. However, the data suggest that Latino sexual norms and behaviors are as varied as the heterogeneous groups they represent. Further research is needed to properly investigate sexual attitudes and behaviors among the individual groups. (End of update by M. A. Pérez and H. L. Pinzón-Pérez]

### [*American Indian (Native American) Sexuality*

WALTER L. WILLIAMS

[*Update 2003:* While the aboriginal cultures of North America were extremely diverse, many Native American religions place a high value on the freedom of each person to follow the dictates of his or her own individual spirit guardian. This focus on individual freedom is exemplified by their accepting attitude toward people's sexual drives. They value sex as a gift from the spirit world, to be freely enjoyed from youth to old age. With this positive view of sex, erotic behaviors are not viewed as "sinful," but rather as expressions of each individual's spirit. With the exception of rape, which is condemned as a violation of a non-consenting person's right to their own sexual inclinations, sex is seen as something to be celebrated rather than denied.

[With this view, among traditionalist Native Americans, sexual exploration is seen as normal for people from early childhood, and traditionalist adults are more likely to view children's erotic expression with amusement rather than

alarm. Children are given great freedom, and their wishes are respected by adults. If a child freely agrees to engage in sex play with another child or with an adult, there is no concept that they are "below the age of consent."

[When a child reaches puberty, a ceremony is common to mark the transition from childhood to adulthood. After puberty, a person is considered an adult and can marry and have children if they choose. While personal attractions and intimate relations are common between spouses, the most important role of marriage in Native American traditional cultures is as an economic arrangement.

[Marriage provides the complementary contributions of both husbands and wives. In aboriginal times, the role of the husband was twofold: He was expected to bring in meat through hunting and also to serve as a warrior to protect the community from outside attack. The wife, likewise, had two major roles: to bring in plant foods (either by gathering wild plants or cultivating domestic plants in farming communities), and to produce children. In hunting-gathering bands and tribes, producing children was an integral part of economic survival. As the parents became elders, they depended upon children to take care of them in their old age. Females' unique ability to give birth and to nurse the young with their breast milk was valued equally to men's warrior roles.

[In fact, the danger of a woman dying during childbirth was as great as the danger faced by warriors at war. Women were honored for subjecting themselves to the danger of childbirth, just as men were honored for subjecting themselves to the danger of warfare. Both warriors and mothers were given social status, as they sacrificed themselves for the good of the band or the tribe. A woman's status was based upon her position as a mother rather than her position as a wife. In matrilineal tribes, even unmarried women who became mothers had high status, and she could live with her female and male relatives in a woman-centered kinship system.

[Marriage, however, was institutionalized primarily for the economic contributions that these close intimate bonds produced. People survived not as husband-wife pairs, but as members of a larger extended-family kinship grouping. Bringing an unrelated person into the household as a new spouse added another person to the economic unit of the extended family. The new spouse's family was considered as in-laws, who might become an additional resource during times of scarcity. Thus, the function of a large extended kinship system was to provide a wide network of persons to whom one could turn during times of need.

[Husbands and wives had sexual intercourse to produce children, but sex was not considered to be limited to its reproductive role. While Christian ideologues have asserted that "the only purpose of sex is reproduction," Native American views do not limit sex to this function. Sex is most importantly seen as a reflection of two people's close intimate bonding and love for each other.

[Another purpose of sex is to cement close intimate relationships between friends. Friendship is considered to be extremely important in Native communities, much more so than in Western culture. Friendships exist between husbands and wives, of course, but close intimate bonds between same-sex friends are also equally valued. Since close relationships between two male "blood brothers" or two close female friends are encouraged by society, these friendships might provide the cover for a sexual relationship. Sex might or might not be involved, but sexual involvement is a reflection of the friendship. Ironically, because friends can freely show emotion to each other, there is little social recognition of private sexual behavior between friends. Their sexual activities are considered to be a private matter between friends.

[The dual system of marriage (promoting close relationships between different genders) and friendship (promoting close same-gender relationships) functioned in aboriginal times to keep band and tribal societies unified. Because sex was an integral part of human relationships, it was viewed positively as an important social force that tied individuals together in wide webs of interpersonal relations. For aboriginal Native American cultures, then, the role of sex in promoting close interpersonal ties was just as important as its reproductive function.

[Among Indian people, homosexual relationships have often existed within the context of close friendships, both between two men and between two women. But in indigenous times, marriage was another matter. Marriage was an economic union of a masculine hunter and a feminine plant provider. This division of labor by gender was not absolute, since food preparation, domestic work, childcare duties, and craftwork varied by culture and even by individual preference. Such activities were often shared by both spouses. Nevertheless, a major purpose of marriage was to provide both meat and plant foods for the survival of the extended family and the rearing of the next generation.

[With marriage partners complementing each other's economic roles, it is not surprising that marriage between two masculine men, or two feminine women, was traditionally frowned upon. A marriage between two hunters or two plant providers would not make sense in terms of economic survival. People needed both meat and plants to survive. Nevertheless, rather than prohibit same-sex marriages altogether, many indigenous Native American cultures recognized homosexual marriages when one partner took on an alternative gender role. Thus, an androgynous or feminine male was expected to marry a masculine man, while a masculine female most likely took a woman as a wife. It was expected that a feminine male would prefer to do women's work, while a masculine female was often noted as a hunter.

[With this cross-labor expectation for transgendered individuals, the mixed-gender nature of marriage could be preserved, while still allowing those persons with same-sex inclinations to fulfill their erotic desires.

[In many aboriginal tribes, the feminine male or masculine female had a special honored role. Because they were seen as uniting the spirit of a man and the spirit of a woman, some indigenous languages referred to these transgendered persons as "two-spirit people." Early French explorers called them "berdache," adapting a Persian word *bardaj*, meaning a close intimate friend of the same sex with whom one had a homosexual relationship. These androgynous roles were seen by native societies as being different and distinct from the regular roles of men and women. Some anthropologists suggest that this pattern is "gender-mixing," while others call it a transgender or alternative gender role. The important point is that Native values allowed for more than two gender options.

[In the concepts of spirituality in many Native shamanistic religions, the person who was different from the average person was thought to have been created that way by the spirits. Two-spirit persons were respected because their "spirit" (i.e., what Westerners refer to as a person's basic character) was more important than their biological sex in determining their social identity. In fact, two-spirit persons were considered to be "exceptional" rather than "abnormal."

[Early European explorers often reported their amazement that many North American Indian tribes respected two-spirit persons as spiritually gifted. Since women had high status in most aboriginal cultures, and the spirit of women was as highly regarded as the spirit of men, a person who combined the spirits of both was seen as having an ex-

traordinary spirituality. Such sacred people were often honored with special ceremonial roles in religious ceremonies, and they were often known as healers and shamans. They had the advantage of seeing things from both the masculine and the feminine perspectives, and so were respected as seers and prophets. Two-spirit people were known as creative persons who worked hard to help their extended family and their community. They often served as healers, artists, performers, and teachers of the young.

[Having such high social and religious status, the sexual behaviors of two-spirit people were also considered sacred. They usually engaged in sex with a person of the same sex, but this was not seen as a homosexual relationship. Instead, it was conceived as a "heterogender" relationship. The distinct gender role of the two-spirit person, reflecting their transgendered spirit, was more important than the physical sex of their body. Thus, the masculine husband of a male two-spirit, or the feminine wife of a female two-spirit, were not considered homosexual. Because the spouse conformed to the standard gender role for their sex, they were considered as a man or a woman, nothing more and nothing less. The fact that their spouse was of the same biological sex was not the defining factor. Therefore, indigenous Native American cultures did not define people by dividing them into two sexual orientations, "heterosexual" or "homosexual." People were defined primarily by their gender role, as reflected in their labor preferences, dress, and personality.

[The fluidity of gender roles and the ease of ending a marriage meant that a person could be married to a two-spirit person of the same sex, but could later marry heterosexually with no change in identity or social status. Or, in the case of Plains tribes where plural wives were common, a masculine man might have a male two-spirit wife in addition to his female wives.

[Native Americans were not the only world cultures to give high veneration to the sacredness of transgendered persons and same-sex marriages. Similar traditions of alternative gender roles that were associated with same-sex erotic behaviors were known in ancient cultures of Asia, Oceania, Africa, and the Middle East. Especially, similar religious traditions exist among the native peoples of Siberia. Since the ancestors of Native Americans migrated from Siberia over 20,000 years ago, this evidence suggests that two-spirit traditions are quite ancient.

[Just as in the case with Native Americans, the expansionist imperialism of homophobic European cultures after 1492 marked the beginning of a new era of attack on transgenderism and same-sex love. The early Spanish conquistadors and Catholic priests killed and tortured two-spirit persons, whom they labeled "sodomites." By the early 20th century, both United States government officials and Christian missionaries were forcing two-spirit people to change their dress and behavior to conform to standard gender roles, and refused to recognize their same-sex marriages.

[Even heterosexual marriages changed drastically among Native Americans under United States domination. The Christian conception of marriage involving only one man and one woman forced men who had plural wives to choose one woman and abandon all of their other wives. Large extended families were largely broken up in favor of nuclear marriage. Marriages that were once easily ended by either spouse were forced to continue, unless the husband and wife went through an expensive and emotionally draining legal divorce process. As a result, many unhappy spouses continued to stay married. Without the protection of her other adult relatives living in the same household, which in matrilineal societies had served to protect women from an angry husband's wrath, domestic violence in-

creased dramatically among 20th-century Indians. Plagued by poverty, alcoholism, and powerlessness, some Native men took out their frustrations on their wives and children. Because of the pervasive influence of missionaries on Indian reservations, many Indians converted to Christianity and absorbed repressive Western attitudes toward sex.

[Despite this deterioration in family relations and traditional sexual freedom, the most astounding fact of life for contemporary American Indians is the revival of traditional Native American religions and values. With this revitalization in recent decades, a new respect for two-spirit people—and a new determination to continue Native attitudes toward sex—has reasserted itself. Native American sexuality has not succumbed to the Western onslaught, but instead has started influencing mainstream American attitudes toward a more accepting and celebratory approach to sex. As among the aboriginal Americans, modern Americans of the 21st century are beginning to see sex as a gift from the spirit world, to be appreciated and enjoyed widely. (*End of update by W. L. Williams*)]

### *Feminism and Sexuality in the United States*

PATRICIA BARTHALOW KOCH  
*A Brief History of the Feminist Movements.* Earlier in this section, we discussed groups that illustrate ways in which religion and race or ethnicity operate as social factors defining subcultures within the U.S.A. and influence sexuality. Gender can be regarded in a similar manner. Here, we now consider feminist perspectives as reflections of a distinct social group or subculture.

Feminism is defined and implemented in various ways by different people. In its broadest interpretation, feminism represents advocacy for women's interests; in a stricter definition, it is the "theory of the political, social, and economic equality of the sexes" (LeGates 1995, 494). Although the terms "feminism" and "feminist" are only about a hundred years old, advocates for women's interests have been active for centuries throughout the world. As Robin Morgan (1984, 5) wrote in *Sisterhood Is Global*, "An indigenous feminism has been present in every culture in the world and in every period of history since the suppression of women began." Throughout history, women have protested, individually and collectively, against a range of injustices—often as part of other social movements in which gender equality was not the focus of the activity and women were not organized to take action on behalf of their gender.

However, stress on the ideologies of liberty, equality, and emancipation of men in the 18th-century political revolutions in Britain, France, and the United States laid the groundwork for these ideologies to be championed in women's lives also. In addition, the Industrial Revolution of the 19th century provided educational and economic opportunities supportive of a feminist movement in many societies.

Actual women's movements, or organized and sustained activities for gender equality supported by a relatively large number of people over a period of years, have occurred since the mid-1800s in many countries throughout the world. The United States, as well as most European societies, experienced extensive women's movements in the closing decades of the 19th century, with another wave of feminism occurring in the 1960s.

The beginning of an organized women's movement in the United States has been traced to the Seneca Falls Convention of 1848 where a Declaration of Principles called for gender equality (Chefetz & Dworkin 1986). Issues addressed included women's legal rights to property, children,

and to their own earnings; equal educational and employment opportunities; the changing of negative feminine stereotypes; and increased opportunities for women to improve their physical fitness and health. These early feminists also addressed more-explicit sexual issues, including the abolition of the sexual double standard of expecting men to be "promiscuous" and women to be "pure"; equality between sexual partners; and the right of married women to refuse sexual activity with their husbands. Yet, although feminist ideology was well developed during these pre-Civil War years, the progressive feminist leaders had few followers. "In the 19th and early 20th centuries the United States was not ready for a mass movement which questioned the entire gender role and sex stratification systems" (Chefetz & Dworkin 1986, 112).

Only when the issues were narrowed to focus upon women's right to vote did the movement gain mass following. By 1917, about two million women were members of the National American Woman Suffrage Association, and millions more were supporters of the women's suffrage campaign (Kraditor 1965). The reasons for supporting a woman's right to vote, however, were varied. For some, it was an issue of basic human rights and gender equality. Many others, who believed in gender-role differentiation, supported suffrage on the basis that women would bring higher moral standards into governmental decisions. This more-conservative perspective dominated the movement. After achieving the right to vote in 1920 with the passage of the 19th Amendment to the U.S. Constitution, this first wave of feminism dissipated.

A second wave of feminism developed within the United States, as well as worldwide, in the 1960s. At this time, many women were finding that, while their participation in educational institutions and the labor force was increasing, their political, legal, economic, and social status was not improving. This American feminist movement came on the heels of the black civil rights movement, which had already focused attention on the immorality of discrimination and legitimized mass protest and activism as methods for achieving equality (Freeman 1995). The contemporary women's movement was organized around many interrelated issues, including: legal equality; control over one's own body, including abortion rights; elimination of discrimination based on gender, race, ethnicity, and sexual orientation; securing more political power; and the ending of institutional and social roadblocks to professional and personal achievement. By the mid-1970s, this issue became a mass movement, with over half of American women supporting many of its principles and demands (Chefetz & Dworkin 1986).

The second women's movement had two origins, from two different strata of society, with different styles, values, and forms of organization (Freeman 1995). Although the members of both branches were predominantly white, middle-class, and college-educated, there was a generation gap between them. The younger branch was comprised of a vast array of local, decentralized, grassroots groups that concentrated on a small number or only one issue, rather than the entire movement. Members tended to adjure hierarchical structure and the traditional political system. Some of the activities in which they engaged included: running consciousness-raising groups; providing educational conferences and literature; establishing woman-supporting services (bookstores, health clinics, rape crisis centers, and battered-women shelters); and organizing public-awareness campaigns and marches. This branch was responsible for infusing the movement with new issues, strategies, and techniques for social change. Many of its projects became institutionalized within

American society (e.g., rape crisis centers) through government funding and entrepreneurship.

These feminists also took their particular perspectives into other arenas, including the pro-choice, environmental, and antinuclear movements. They also had an impact on academia, establishing women's centers and women's studies departments, programs, and courses on campuses throughout the country. By the early 1980s, there were over 300 women's studies programs and 30,000 courses in colleges and universities, and a national professional association, the National Women's Studies Association (Boxer 1982). Many periodicals devoted exclusively to scholarship on women or gender were begun; Searing (1987) listed 94 such journals.

The second branch of the women's movement was the older, more-traditional division that formed top-down national organizations with officers and boards of directors, and often paid staffs and memberships. Most of these organizations sought support through contributions, foundations, or government contracts to conduct research and services. Some of these feminist organizations included: the Women's Legal Defense Fund, the Center for Women's Policy Studies, the Feminist Majority Foundation, and the National Coalition Against Domestic Violence, with other previously established groups taking on a more-feminist agenda, such as the National Federation of Business and Professional Women and the American Association of University Women.

The National Organization for Women (NOW), an action organization devoted to women's rights, was the primary feminist group to develop a mass membership. NOW focused its attention at the national level to become politically powerful. One of its major campaigns was the passage of an Equal Rights Amendment (ERA) to the U.S. Constitution guaranteeing legal equality for women. The ERA was endorsed by the U.S. Congress and sent to the states for ratification in 1972. In 1978, over 100,000 people marched in Washington D.C. in support of the Equal Rights Amendment. But the ERA and feminism were to meet with strong opposition from well-organized conservative and right-wing political and religious groups that depicted feminist goals as "an attack on the family and the American way of life" (Freeman 1995, 525). Stop-ERA campaigns were adeptly organized by these politically savvy groups and, by 1982, the ERA had failed to pass within the allotted timeframe by seven votes in three states.

Yet, it cannot be said that the feminist movement failed. Many states passed equal rights amendments of their own, and many discriminatory federal, state, and local laws were changed with the Supreme Court unanimously ruling in favor of interpreting constitutional law to provide equal opportunity for women. In addition, a powerful women's health movement had been spawned, and efforts for reproductive freedom, including abortion rights, would be continued to combat anti-abortion groups throughout the 1980s and 1990s. As Freeman (1995, 528) concluded: "The real revolution of the contemporary women's movement is that the vast majority of the [United States] public no longer questions the right of any woman, married or unmarried, with or without children to work for wages to achieve her fullest potential."

Although feminists agree there are still many strides to be made in achieving the goals of legal, economic, political, and social equality for women in the United States, they are often divided over philosophy, goals, and strategies for achieving equality in these areas. Feminism is not a monolithic ideology. There is "not a single interpretation on what feminism means but a variety of feminisms representing diverse ideas and perspectives radiating out from a core set of

assumptions regarding the elimination of women's secondary status in society" (Pollis 1988, 86-87).

*Feminism and Sexuality.* Sexuality has always been a critical issue to feminists, because they see the norms regarding "proper" and "normal" sexual behavior as functioning to socialize and suppress women's expression and behavior in an effort to control female fertility as socioeconomic and political assets (Tiefer 1995). "The personal is political," the feminist rallying cry, applies particularly to sexuality, which is often the most personal, hidden, suppressed, and guilt-ridden aspect of women's lives. MacKinnon (1982, 515) captures this essence well in the analogy that: "Sexuality is to feminism what work is to Marxism: that which is most one's own, yet most taken away."

Although women are now being seen as sexual beings in their own right, not simply as reproducers or sexual property, Tiefer (1995, 115) describes how women's sexual equality is still constrained by many factors, including:

Persistent socioeconomic inequality that makes women dependent on men and therefore sexually subordinate; unequal laws such as those regarding age of sexual consent and rights in same-sex relationships; lack of secure reproductive rights; poor self-image or a narrow window of confidence because of ideals of female attractiveness; ignorance of woman-centered erotic techniques, social norms about partner choice; and traumatic scars from sexual abuse.

In general, feminists believe that both women's and men's sexuality is socially constructed and must be examined within its social context (McCormick 1994). Gender-role socialization is viewed as a very powerful process creating unequal power relationships and stereotypic expectations for appropriate sexual feelings and behaviors of women and men. Male gender-role socialization based on male political, social, and economic dominance is likely to result in male sexual control, aggression, and difficulties with intimacy. On the other hand, female gender-role socialization based on political, social, and economic oppression of women is likely to result in disinterest and dissatisfaction with sex, as well as passivity and victimization. Feminists question the assumption of a binary gender system and challenge traditional concepts of masculinity and femininity (Irvine 1990). They politicize sexuality by examining the impact that power inequalities between men and women have on sexual expression.

Although most feminists may agree upon the relevance of socialization and context in the creation of male and female sexuality, they may vehemently disagree about the nature of sexual oppression and the strategies for its elimination (McCormick 1994). This has resulted in the emergence of two major feminist camps: radical feminists and liberal feminists.

As described by McCormick (1994, 211), radical feminists have polarized male and female sexuality—often demonizing men and idealizing women in this process. They view women as victims who must be protected. They use evidence showing girls and women as the predominant victims and boys and men as the perpetrators of rape, sexual harassment, prostitution, domestic violence, and childhood sexual abuse to support their views.

Radical feminists are vehemently opposed to pornography, "likening erotic images and literature to an instruction manual by which men are taught how to bind, batter, torture, and humiliate women" (McCormick 1994, 211). They have spearheaded many efforts to censor pornographic/erotic materials, often joining with right-wing organizations in these efforts. Another goal of radical feminists is the

elimination of prostitution, which they view as trafficking in women's bodies. They believe that all women in the sex trades are being victimized.

Because of these beliefs, radical feminists are criticized as treating women as children who are incapable of giving true consent to their choice of sexual activities. In response, these feminists argue that it is our sociopolitical system that treats women as second class and has robbed them of the equality needed for consensual sexual expression. Until this system is changed, true consent from women is not possible. In fact, orthodox radical feminists do not recognize the possibility of consensual heterosexuality, finding little difference between conventional heterosexual intercourse and rape, viewing both acts as representing male supremacy (McCormick 1994, 211). Radical feminists are accused of advocating "politically correct sex" by idealizing monogamous, egalitarian, lesbian sex and celibacy, and rejecting any other forms of consensual relationships or activity.

On the other hand, liberal feminists defend women's rights to sexual pleasure and autonomy. They believe that, if women are viewed only as victims, they are stripped of their adult autonomy and their potential to secure joyous and empowering sexual pleasure and relationships on their own behalf (McCormick 1994, 211). These feminists do not view all erotic material as harmful and believe in women's right to create their own erotic material. They differentiate between the depictions of forced sex in pornography and actual violence against women. Although not always pleased with all types of pornographic material, they believe in the right of free speech and choice, and acknowledge that censorship efforts could never eliminate all pornographic material anyway. In addition, who is to decide what is pornographic and what is erotic? Regarding prostitution, they view sex work as a legitimate occupational choice for some, and acknowledge the tremendous range of experience with sex work primarily based on social class.

Liberal feminism dominated the first phase of the women's movement of the 1960s. The emphasis was on women's empowerment to achieve professional and personal, including sexual, potentials. The expansion of sexual possibilities was explored, with pleasure being emphasized. The strategies of consciousness-raising, education, and female-centered care were used to help eliminate sexual shame and passivity, with women being encouraged to discover and develop new sexual realities for themselves (Tiefer 1995, 115). However, beginning in the 1970s, the pendulum began to swing away from an emphasis on the power of self-definition towards the agendas of the radical feminists who emphasized issues of sexual violence against women, including rape, incest, battery, and harassment. Thus, during this current feminist movement, much more time and emphasis has been devoted to women's sexual victimization, danger, and repression than to women's sexual equality, pleasure, and relationship enhancement.

Today, many in the general public, professionals, and even sexologists fail to distinguish between differences within feminism. They are most aware of and react primarily to the radical-feminist ideologies and strategies. Thus, feminism has become stereotyped by the extreme positions of the radicals and seems to have lost much of its overt mass support, with many trying to distance themselves from these extreme positions. For example, it is not unusual to hear someone today say, "I believe in women's rights but I'm not a feminist."

*Feminist Critiques of and Contributions to Sexology.* Feminist sexology is the scholarly study of sexuality that is of, by, and for women's interests. Employing diverse epistemolo-

gies, methods, and sources of data, feminist scholars examine women's sexual experiences and the cultural frame that constructs sexuality. They challenge the assumptions that sexuality is an eternal essence, arguing "that a kiss is not a kiss and a sigh is not a sigh and a heterosexual is not a heterosexual and an orgasm is not an orgasm in any trans-historical, transcultural way" (Tiefer 1995, 597). These theories and approaches have resulted in an enormous body of work during the last two decades reexamining theories, methods, and paradigms of gender and sexuality, and contributing to social change (Vance & Pollis 1990).

During this time, feminists and others have challenged the preeminence and validity of traditional science, particularly as it has been applied to human beings and their behaviors. They have argued that traditional science, rather than being objective and value-free, takes place in a particular cultural context (one that is often sexist and heterosexist), which thus becomes incorporated into research, education, or therapy (McCormick 1994). For example, research on unintended and adolescent pregnancy is focused almost exclusively on females, reflecting a double standard requiring women to be the sexual gatekeepers while relieving men of such responsibilities.

Another example comes from therapy. Numerous studies have determined that relationship factors, including intimacy, nongenital stimulation, affection, and communication, are better predictors of women's sexual satisfaction than frequency of intercourse or orgasm. Nevertheless, the dominant therapeutic paradigm, as enforced by the *Diagnostic and Statistical Manual of Mental Disorders*, uses physiologically based genital performance during heterosexual intercourse as the standard for determining women's sexual dysfunctions (Tiefer 1995).

Feminist scholarship uses the following principles in overcoming the deficits in understanding of women's experiences, gender and gender asymmetry, and sexuality:

1. Acknowledgment of the pervasive influence of gender in all aspects of social life, including the practice of science;
2. A multifaceted challenge to the normative canons of science, especially the tenet of objectivity, which splits subject from object, and theory from practice;
3. Advocacy of consciousness raising as a research strategy that elevates and legitimates experience as a valid way of knowing, essential to uncovering meaning structures and diversity among individuals;
4. Conceptualization of gender as a social category, constructed and maintained through the gender-attribution process, and as a social structure;
5. Emphasis on the heterogeneity of experience and the central importance of language, community, culture, and historical context in constituting the individual; and
6. Commitment to engage in research that is based on women's experience and is likely to empower them to eliminate sexism and contribute to societal change (Pollis 1986, 88).

Sexology has been criticized for being reticent to integrate feminist perspectives and scholarship into its establishment for fear of being perceived as unscientific and radical (Irvine 1990). However, in recent years, feminist perspectives have become more visible in the scholarly journals, conferences, and among the membership and leadership of professional sexological organizations. Future goals for feminist sexologists include more attention to understanding the intersections of race, class, and culture within gender, and making the results of their work more usable.

*[The Emergence of Men's Perspectives on Sexuality*

WARREN FARRELL

[Update 2003: In the 1950s, both sexes were defined by roles. In the early 2000s, men are still defined largely by roles; women define themselves. (The following discussion is based on the author's *The Myth of Male Power*, Farrell 1993/2001). As the women's movement has helped women develop options and no men's movement of any consequence has done the same for men, we have entered the Era of the Multi-Option Woman and the No-Option Man. Thus, in the U.S., our daughters now have the option to join the armed services, but our sons have no option but to register for the draft.

[The Era of the Multi-Option Woman and the No-Option Man extends itself to the sexual arena (see also: Bly 1990; Cassell 1993; Farrell 1999; Goldberg 1977; Gurian 1977; Halpern 1994; Jeffers 1989; Kipnis 1991; La Framboise 1996; Lyndon 1992; Lynch 1999; Philpot 1997; Simon 1995):

- Young women now have the *option* of asking a man out on a date; young men have the *expectation*.
- Young women now have the *option* of taking sexual initiatives (e.g., being the first to kiss); young men have the *expectation*.
- On a date, young women now have the *option* to pay; young men have the *expectation*.
- Parents are more likely to let their children watch a man using a gun to kill than to watch a man using his penis to have sex (see also Fekete 1994). In essence, we say sex is dirty, then we tell our sons it is their responsibility to initiate the dirt. We expect the boy to do this before he understands either sex or girls. This leaves most boys feeling morally inferior to most girls—having to compensate for their inequality by buying drinks, dinners, and diamonds.
- Girls and boys today often hang out in groups before they date. The politics of turning a group friendship into a one-on-one sexual encounter can be even more daunting than asking out a girl one barely knows. Why? It hurts more to be rejected by someone we know in front of a group than by someone we do not know.
- We have developed a birth control pill for women, but no pill for men. For more than a decade, the ability to do this technologically has been within five to seven years of achievement, but the politics have prevented it (see Farrell 2001 for sections on reproduction and abortion; see also Money 1988/1990).
- If a man and woman have sex, the woman can abort or sue for support; he has no rights to learn about the abortion and no right to avoid paying child support.
- If the result of sex is a child raised by a mother and father, she is 135 times more likely to have left the workplace to raise the child than is he, and therefore, should there be a divorce, she is able to claim that the child should be raised primarily by her to create stability. Under these circumstances, should the father wish 50% involvement after divorce, he can expect to pay more than \$100,000 to fight for it—and still be unlikely to get it.
- If men were to articulate their potential rights in the areas of sex, reproduction, and parenting, they might be called Men's ABC Rights:
  - Men's A right relates to Abortion—to an equal say in whether a fetus he would be responsible to support if it became a child, should in fact become a child; or conversely, an opportunity to legally agree to support the child emotionally and financially completely by himself in exchange for the woman not aborting the child.
  - Men's B right relates to Birth Control—the right to a male birth control pill being made a national priority

so men can both relieve women of the primary responsibility for contraception, and have equal rights to the convenience of a pill.

- Men's C right relates to Caring—men's equal right to stay at home and care for the child during marriage, and to care for it equally should there be a divorce.
- When women marry someone they meet in the workplace, it is usually a man above them at work who took the initiative—also the most frequent form of sexual harassment. When it works, it is called courtship. When it does not work, it is called harassment (see also Symons 1981). If the courtship continues, it is called a marriage, with the woman's picture in the paper; if it breaks up, it is called a lawsuit, with the man's picture in the paper. Many men, then, walk a fine line between being a candidate for husband and a candidate for harasser.
- In the workplace, if a woman caresses a man on the rear, he is likely to say, "thank you"; if a man caresses a woman on her rear, she is likely to say "sue you." Women's preference is the law; a man who exercises his preference is an outlaw.
- Several top universities, such as Berkeley, Harvard, and Swarthmore, already allow a woman who is drunk to claim the next morning that she was raped, even if she said "yes" the evening before! Many men feel a top university that does not ask women to take responsibility for the choice of getting drunk neglects to prepare women for the responsibility of leadership in business or politics. They feel it would be like a law that excused drunken driving with the rationalization that if a person had too much to drink, they are not responsible (see also Roiphe 1993).

[Many men feel the feminist movement has persuaded the public that men had the power, and that men used women to serve men's sexual needs at the expense of women's. The average heterosexual male, though, desires sex a lot more than he has it. It is in his interest to have women be more sexual, not less; to wear fewer clothes, not have faces covered by veils; to have sex without children, not have children and be deprived of sex. From his perspective, women are to sex what the OPEC nations are to oil: the more they keep it in short supply, the more power they have.

[A more accurate view than the feminist perspective of the gender politics of sex, according to many of these men—in organizations such as the National Coalition of Free Men—is best discussed in books like *The Myth of Male Power*. *The Myth of Male Power* explains how sexual harassment and date rape legislation both hold only the man responsible for the traditional male role of taking the direct sexual initiatives; neither holds the woman responsible for the traditional female role of taking indirect sexual initiatives. The following serve as some examples (see also Gelles & Straus 1988).

[*Sex in the Workplace*. For example, *Cosmopolitan*, which has been the bestselling magazine to single women during the entire women's movement—and still is—features articles instructing women how to take indirect sexual initiatives. Thus, a real article titled, "How to Catch a Man at Work," tells her (and I'm quoting *Cosmo* here), "As you pass his desk, drop a pile of papers or a purse, then stoop down to gather them up. He'll help. Lean close to him, put your hand on his shoulder to steady your balance. . . ." Or, "Immediately after you meet him, touch him in some way, even if it's to pick imaginary lint off his jacket." Or, "Brush up against him in the elevator." Or "If you have good legs, wear a very tight, short skirt and high heels. Bend over with your back to a man (to pick up something or look in a file

drawer)." Of course, it's hard for a man to say, "Your honor, I initiated because she picked imaginary lint off my jacket."

[The problem with indirect initiatives is when the wrong man approaches the woman who has leaned over the file drawer in her tight, short skirt; suddenly, an environment she's helped to create feels hostile. But only he becomes vulnerable to a lawsuit.

[Is it possible there is something deeper—maybe unconscious—going on here? First, sexual harassment lawsuits can sometimes be the latest way of making men have to overcome barriers to be sexual with women in an era when the birth control pill had reduced those barriers (see also Symons 1981). Second, prior to divorces becoming popular, women had their source of income guaranteed for a lifetime. Once divorces became acceptable, though, feminists began to demand that the government become a substitute husband (Gilder 1987)—thus, the EEOC's decision number 84-1 allows complaining to a girlfriend at work to be "sufficient to support a finding of harassment" (Pollak 1991). That used to be called gossip. Now it's called evidence.

[In one decade, then, women had gotten more protection against offensive jokes in the workplace than men had gotten in centuries against being killed in the workplace. For example, one construction worker dies every workday hour—yet in the U.S., we have six fish-and-game inspectors for each workplace inspector (see also Kimbrell 1995). The plea for female protection is ironic, since feminists were the first group to decry how protective legislation discriminated against women by not allowing women to be hired in certain positions. The protection desired is from men's methods of sexualizing the work environment, not women's. For example:

[*Miniskirts-Without-Repercussions*. The miniskirt, long nails, nail polish, and indirect initiatives were historically designed to catch a man, lead to marriage, and therefore, in the past, to the end of a woman's involvement in the workplace. These indirect initiatives, therefore, unconsciously signal to a man that this woman wants an end to her involvement in the workplace (see also Cassell 1993). Feminists, though, have not asked the government to make laws against this form of sexualizing the workplace.

[*"Dirty" Jokes*: Feminists often claim that dirty jokes are the male method of intimidating women. In fact, men tell dirty jokes to peers in order to bond, not intimidate. When a male boss tells a dirty joke, it's often his unconscious way of getting his staff to not take him so seriously and, therefore, not be intimidated (see also Fekete 1994; Roiphe 1993).

[*Hazing Versus Harassment*. Historically, men knew that if a man was preoccupied with his vulnerability, he couldn't protect. So a short guy will be hazed with jokes like, "Which is higher, your IQ or your size?" All novices were hazed before they could be accepted as part of the team. Men test men before men trust men. From a man's unconscious perspective, *if a woman isn't being hazed, she's not being tested and therefore, she's not being trusted*.

[*Better Solutions Than Current Workplace Sex Regulations*. How would many men want to deal with sexual contact in the workplace?

[Step one: Resocializing women to share responsibility for taking sexual initiatives, rather than just blaming men when they do it wrong. Men will be our sexual harassers as long as men are our initiators.

[Step two: Changing "sexual harassment" seminars to "sexual contact in the workplace" seminars in which men can also discuss the effect of the *Cosmo*-type indirect initiatives.

[Step three: If a woman feels sexually harassed, encourage her to tell the man directly. Most men want to please women, not anger women.

[*The Politics of Date Rape*. A date obviously does not imply permission to be sexual, which, therefore, allows the possibility of date rape. From both sexes' perspective, date rape is not only a legitimate issue, but a serious one, because when a woman is raped by a man she is dating, her ability to trust is raped even more than when she's raped by a stranger (whom she had no expectation of trusting). Every time a woman experiences a date rape, every man is also hurt—because every man in that woman's life will be less trusted and have more to prove than he otherwise would (see also Roiphe 1993).

[The problem is the politics of date rape. The word "rape" has become to sexual politics since the 1980s what the word "communism" became to American politics in the 1940s and 1950s: When the mere accusation can result in the assumption of guilt, it is a setup for false accusations to be levied at any enemy. When this exists in an atmosphere in which famous people like Marilyn French (author of *The Women's Room*) can say, "All men are rapists and that's all they are" (Jennes 1983), without protest, and a Vassar College Assistant Dean of Students can be quoted in *Time* magazine saying, "Men who are unjustly accused of rape can sometimes gain from the experience" (attributed to Vassar College Assistant Dean of Student Life, Catherine Comins, in Gibbs 1991),<sup>1</sup> without protest, then men have become the new communists.

[The flaw is that none of this holds women responsible for their part in the male-female dance. Yet, 25 million women in the U.S. read an average of 20 romance novels per month, often featuring the formula of a working woman who is approached by a successful man, the woman resisting, the man overcoming her resistance, and the woman getting "swept away" (see also Cassell 1993). The book titles that sell best to women are titles like Danielle Steele's *Sweet Savage Love*, in which the heroine marries her rapist and rejects the man who saves her; they do not include titles like *He Stopped When I Said No*.

[Twenty-five million women is five times the number of readers of *Playboy* and *Penthouse* combined. The solution to the politics of date rape must include recognizing that his overcoming her resistance may be her fantasy at least as much as his. It also includes thinking of men not as the political enemy, but as our sons. For example, imagine your son dating a woman from Vassar who feels that a man could gain from being falsely accused of rape. When your son comes home for the holidays and tells you he might be spending next semester in prison—where he will be considered "fresh meat" by the prisoners—do you tell him, "Don't worry, boys who are unjustly accused of rape can sometimes gain from the experience"? Do you feel good about paying taxpayer dollars to support colleges that subject your son to random acts of imprisonment because he wasn't born as your daughter? Now suppose your son entered the armed services rather than college, how would you feel about the U.S. Air Force study that was kept quiet because it discovered that 60% of the rape accusations turned out to be false—not unfounded, but false?<sup>2</sup> (see also Lynch 1997).

<sup>1</sup>I called Catherine Comins and then faxed a letter to her at Vassar to be certain she was not misquoted. She did not respond.

<sup>2</sup>Written correspondence to me from Charles P. McDowell, Ph.D., M.P.A., M.L.S., Supervisory Special Agent of the U.S. Air Force Office of Special Investigations, March 20, 1992. This is based on an Air Force study of 556 rape allegations.

[So the big question is: How do we make dating the most positive experience possible for both our daughters and our sons? Do we do that by criminalization, or by resocialization? Thus far, we've focused on criminalization—and the criminalization has been focused on criminalizing only the male role.

[One reason we have focused on criminalization is our acceptance of the belief that rape is a manifestation of male political and economic power. In fact, any given black man is three times as likely as a white man to be reported as a rapist. Do blacks suddenly have more political and economic power? Maybe rape does not derive from power, but rather from powerlessness.

[To check this out, we must challenge the current belief that rape has nothing to do with sexual attraction—it is just an act of violence, and that this is “proven” by the fact that women of every age are raped. In fact, being at the age of greatest sexual attraction makes the chances of being raped at least 8,400% greater than being raped at an age over 50 years old. That is, when a woman is between ages 16 and 19, her chances of being raped are 84 in 20,000; when she is between 50 and 64, her chances are less than one in 20,000 (USBJS 1987). Sexual attraction, then, does have something to do with who is raped.

[If rape were just an act of violence, then it should not be distinguished from any other violent crime. Other violent crimes are not distinguished by the body parts involved. If they were, “assault to the head” is a crime deserving greater punishment than rape, unless feminists are saying that a woman's vagina is more important than a woman's head.

[We hear that date rape is always a crime, never a misunderstanding. Yet, anyone who works with both sexes knows it is possible for a woman to go back to a man's room, tell him she doesn't want to have intercourse, mean it, start kissing, willingly have intercourse, and then wish she had not in the morning. How? Kissing is like eating potato chips. Before we know it, we've gone farther than we said we would, and in the morning we regret it. But that doesn't mean Lay's raped us. Date rape can be a crime, a misunderstanding, or buyer's remorse (see also Farrell 1986).

[Solutions to Date Rape and Stranger Rape. Since men rape, is it not really the man's role that needs changing?

[The problem is both sexes' roles: It is both sexes' roles together which create the following four factors that make rape a predictable possible outgrowth of male-female relationships in most cultures (see also Kammer 1994; Levin 1988).

1. Boys' “addiction” to sex with girls being reinforced, even as girls' sexual caution is reinforced (through pregnancy, herpes, and AIDS, for example). The consequence? An increase in the gap between male demand and female supply.
2. Saying “sex is dirty” and “boys, initiate the dirt.” The consequence? Boys being the mistrusted sex.
3. Because boys are mistrusted more, they're rejected more; and because they want more sex than the girls do, they're rejected still more. The consequence? Rather than take rejections personally, a boy learns to turn a woman into a sex object—it hurts him less to be rejected by an object.
4. Being objectified makes her feel alienated and being rejected makes him feel hurt, angry, and powerless. When rejection and sexual identity go hand in hand, we sow the seeds of violence—especially among boys who have no source of power. His violence and objectifying reinforce the starting assumptions: Sex is dirty and dangerous, and men can't be trusted. This power-

lessness is reinforced by “The Male Date Rape Catch-22:” society telling men to be the salespersons of sex, then putting only men in jail if they sell well.

[Some feminists are now expanding the definitions of rape to “unwanted sexual activity.” Yet, the *Journal of Sex Research* reported the findings that 63% of the men and 46% of the women said they had experienced unwanted intercourse (Muehlenhard & Cook 1988). (For example, a man sometimes fears intercourse when he feels a woman will read into it more of a commitment than he wants.) By feminist definitions of rape as unwanted sex or unwanted intercourse, most men have been raped—and that's how rape begins to look like an epidemic. It is also how rape gets trivialized.

[In Conclusion. To go from the old “male pursue/female resist” to the feminist “male pursue/female sue” is not progress, but just the latest method of getting men to jump through brand-new hoops for the same old sex.

[Men will be our rapists as long as men are our initiators. Men will rape as long as the four factors leading to rape are part of our two-sex socialization. The solution lies in updating the dance—in women and men sharing responsibilities for the direct initiative-taking and paying for dates—in communication, not litigation or criminalization.

[Sexual harassment and date rape are perfect metaphors for some of the most important challenges of the 21st century: the challenge to the stereotype of “innocent woman/guilty man”; the challenge to keep male-female sexual contact flexible and fluid rather than petrified and paralyzed; the challenge to respond to sexual nuance more with communication and less with legislation—understanding that communication at least responds to nuance with nuance, while legislation responds to nuance with rigidity; and the challenge to our genetic heritage of protecting women—and therefore infantilizing women.

[If we really want to protect people from being hurt, we would have to make laws against love, and against marriage, automobiles, and gossip. The only way we can prevent people from being hurt is to prevent them from living. If we desire to protect men from hurt, we would have to outlaw women's sexual rejection of men.

[The answers we develop cannot emerge from feminism-in-isolation, but from both sexes helping each other reweave the tapestry that has been passed from one generation to the next over the centuries for purposes that were functional then, but dysfunctional now (see also Sommers 1994; Steele 1990). Only then will we make a transition from a woman's movement *versus* a men's movement to a gender transition movement—from gender war to gender love.

[*Heterophobia: The Evolution of an Idea*

RAYMOND J. NOONAN

[Update 2003: The term *heterophobia* is, perhaps, only about two decades old—a much shorter period than its more familiar sibling, *homophobia*, which *Webster's Ninth New Collegiate Dictionary* dates to 1958. Still, the value of heterophobia as a concept appears to be largely unrecognized among many, if not most, American sexologists today

as sexual science and philosophy advances into the new millennium. Is heterophobia just another example of the me-too victimology that continues to grow and flourish in contemporary America? Or is there more to it from which students of sexology and the general public can learn?

[*Webster's* defines *homophobia* simply as the "irrational fear of homosexuality or homosexuals" (p. 578); the term *heterophobia*, however, does not appear at all. It does appear in Francoeur, Perper, & Cornog's 1995 *Complete Dictionary of Sexology*, where they define it similarly as a fear of heterosexuals, although they do not use the "irrational" component. *Heterophobia* also appears among the myriad other terms for various phobias in some of the comprehensive lists of phobias published on the World Wide Web. In a non-sex-related context, it has also been defined as a fear of things different (such as other cultures).

[*Heterophobia* appeared for the first time in the 1982 book, *The Anatomy of Freedom*, by the well-known feminist, Robin Morgan. In the sexological literature, *heterophobia* first seems to have appeared in print in a 1990 chapter by Edward W. Eichel in the controversial book *Kinsey, Sex and Fraud*, in which he devoted the chapter to the "new" concept of "heterophobia," although I recall having heard and thought about it in the early 1980s. Eichel defined it similarly to Francoeur et al.'s definition in their *Dictionary*. In 1996, Raymond J. Noonan, this author, discussed the term in one of his chapters in the book, *Does Anyone Still Remember When Sex Was Fun?* in which he equated it more with the general antisexualism of American culture. He broadened the definition and used it more as a synonym for this generalized sex-negativity that has crystallized around heterosexual behavior—particularly against heterosexual males—and especially against heterosexual intercourse (see Noonan, 1996b, 1997, 1998a). In that book, he also introduced the concept of "internalized heterophobia." Later, he suggested that homophobia was, in fact, partially enabled and empowered by heterophobia, as the significant impetus for the hostility is probably more often from the "sexual" root of *homosexual* than on the "homo" prefix, which incites only slightly more, overall. Still, some of the fuel for heterophobia may also be rooted in the current misandrist sentiments that have become more prevalent in some quarters of American society in recent years. Misandry, of course, may or may not be in reaction to misogyny, which appears to have become somewhat less prevalent.

[In late 1998, however, *heterophobia* appeared for the first time in the title of a book—the first comprehensive treatment of the subject by anyone inside or outside of sexology. In *Heterophobia: Sexual Harassment and the Future of Feminism*, Daphne Patai tied the concept to what she called the Sexual Harassment Industry (SHI), which was being used, she argued, to separate men and women for often personal or political gain or self-interest. She defined *heterophobia* as the "fear of, and antagonism toward, the Other—in the present context men in general—and toward heterosexuality in particular" (p. 5). She went on to document how this hostility, which "is not limited to the lunatic feminist fringe where it originated in the late 1960s" (p. 14), was being implemented by the expansion of sexual harassment indoctrination sessions and laws.

[More recently, it is interesting to note that Meignant, et al., the authors of the entry on France in this volume of the *Continuum Complete International Encyclopedia of Sexuality*, have selected *heterophobia* as the term to describe their conception of a heterosexuality-heterophobia scale, positing that it is heterophobia that is the opposite of heterosexuality and not homosexuality at the other end of Kinsey's continuum. Their model includes a separate homosex-

uality-homophobia scale conceived as opposites as well. I would be more inclined to consider as more accurate a heterophobia-heterophilia scale, as well as a homophobia-homophilia scale, based solely on the traditional contrast inherent in the meanings of the Greek roots. Also, most sexologists consider Kinsey's scale to be a continuum, and not a description of opposites. In addition, as heterosexuality, bisexuality, and homosexuality have begun to be seen as multidimensional, Kinsey's scale has been increasingly applied to each dimension, resulting in a non-integer composite score, not necessarily congruent across all dimensions.

[Thus, the term is confusing for many people for several reasons. On the one hand, some look at it as just another of the many me-too social constructions that have arisen in the pseudoscience of victimology in recent decades. (Many of us recall John Money's 1995 criticism of the ascendancy of victimology and its negative impact on sexual science, which is recommended reading for insights into the history of the problem.) Others look at the parallelism between heterophobia and homophobia, and suggest that the former trivializes the latter. Yet, heterophobia may be one of the root contributors in the etiology of homophobia, as noted earlier. For others, it is merely a curiosity or parallel-construction word game. But for others still, it is part of both the recognition and politicization of heterosexuals' cultural interests in contrast to those of gays—particularly where those interests are perceived to clash.

[Indeed, the last sense parallels the use of *homophobia* as a political epithet to stigmatize those who are opposed to gay lifestyles regardless of their reasons—suggesting that religious or moral opposition, for example, is based on mental illness. Increasingly, some writers have argued for a more-descriptive term, such as *homonegativity*, that does not rely on quasi-scientific ambiguity based on an etymological relationship with the psychological concept of phobia. Its heterosexual counterpart would then be *heteronegativity*. Both may be conceptualized as *internalized* as well.

[As such, recognition of the impact of heterophobia on sexual health, research, and education in American culture is on the cutting edge of contemporary sexology. In effect, heterophobia has become an unacknowledged—and often unmentionable—force that influences public policy, as well as sexual science, and, in silent alliance with conservative religious and other social forces, determines how sexual issues as a whole are studied or not studied—as well as how sexual lives are lived by women and men and their relationships together—in contemporary American society. (*End of update by R. J. Noonan*)]

### General Summary of Social Factors

PATRICIA BARTHALOW KOCH

This discussion of social factors influencing sexuality in the U.S.A. has selectively focused on religion, race/ethnicity, and gender. Essentially, we have taken the view that such social variables exert influence largely through membership in corresponding social groups. Our review examined the general tradition of the Judeo-Christian heritage of the U.S.A., membership in the Mormon church and the re-emergence of "sacred sexuality," African-American, Latino, and Native American minority groups, identification with feminist and men's perspectives, and heterophobia as specific examples.

We recognize that this approach omits other important social factors, such as education, social class, and size of city of residence. Our purpose has not been to provide an exhaustive review of all pertinent social groups within the U.S.A. Rather, we wished to demonstrate the abundant evidence that a full understanding of sexuality in American culture

eventually will require a recognition of the diverse social groups that reside in this nation. As we proceed to examine what sexuality researchers have learned about specific forms of sexual attitudes and behavior, the authors will report, where possible, the results of research which documents an association between sexuality and social variables.

Unfortunately, a recognition of these associations has not always been incorporated into investigations of sexual practices. For example, much of the existing research has been conducted with predominantly white, middle-class, college-educated populations. Researchers have frequently failed to adequately describe the demographic characteristics of their samples, and they have often failed to test possible correlations with social variables. One consequence is that American sexual scientists have yet to develop a full understanding of the very diversity of social groups we have tried to describe. Closing such gaps in our knowledge remains one of the principle tasks of sexual science in the United States.

### 3. Knowledge and Education about Sexuality

PATRICIA BARTHALOW KOCH

According to the National Coalition to Support Sexuality Education,

Sexuality education is a lifelong process of acquiring information and forming attitudes, beliefs, and values about identity, relationships, and intimacy. It encompasses sexual development, reproductive health, interpersonal relationships, affection, intimacy, body image, and gender roles [among other topics]. Sexuality education seeks to assist children [people] in understanding a positive view of sexuality, provide them with information and skills about taking care of their sexual health, and help them to acquire skills to make decisions now and in the future. (SIECUS 1992)

#### A. A Brief History of American Sexuality Education

Sexuality education in the United States has always been marked by tension between maintaining the status quo of the "acceptable" expression of individual sexuality, and change as precipitated by the economic, social, and political events of the time. The major loci for sexuality education have shifted from the family and the community (in earlier times being more influenced by religion, and in modern times, by consumerism and the media), to schools. Much of the education has been developed by and targeted towards middle-class whites. As will be described in more detail, the two major movements to formalize sexuality education in the United States were spearheaded for the advancement of either "social protection" or "social justice." Throughout history, the goals, content, and methodologies of sexuality education in these two movements have often been in opposition to one another.

According to D'Emilio and Freedman (1988), young people in colonial America learned about sexuality through two primary mechanisms. In these agrarian communities, observation of sexual activity among animals was common. Observation of sexual activity among adults was also common, since families lived in small, often-unpartitioned dwellings, where it was not unusual for adults and children to sleep together. Second, more formal moral instruction about the role of sexuality in people's lives came from parents and clergy, with lawmakers endorsing the religious doctrines. The major message was that sexual activity ought to be limited to marriage and aimed at procreation. However, within the marital relationship, both the man and

woman were entitled to experience pleasure during the procreative act.

Ministers throughout the colonies invoked biblical injunctions against extramarital and nonprocreative sexual acts, while colonial statutes in both New England and the Chesapeake area outlawed fornication, rape, sodomy, adultery, and sometimes incest, prescribing corporal or capital punishment, fines, and in some cases, banishment for sexual transgressors. Together, these moral authorities attempted to socialize youth to channel sexual desires toward marriage (D'Emilio & Freedman 1988, 18).

A small minority of colonists also were exposed to a limited number of gynecological and medical-advice texts from London. These underscored the primary goal of sexuality as reproduction, with pleasure only to be associated with this goal.

After the War for American Independence, small autonomous rural communities gave way to more-commercialized areas, and church and state regulation of morality began to decline. Individual responsibility and choice became more emphasized. Thus, instruction on sexuality changed from community (external) control to individual (internal) control. For example, between the 1830s and 1870s, information about contraceptive devices and abortion techniques circulated widely through printed matter (pamphlets, circulars, and books) and lectures. However, peer education was the primary source of sexuality education, with more-"educated" people, especially women, passing along their knowledge to friends and family members.

Increasing secularization and the rise of the medical profession spawned a health-reform movement in the 1830s that emphasized a quest for physical, as well as spiritual, perfection. With advances in publishing and literacy, a prolific sexual-advice literature, written by doctors and health reformers of both genders, emerged. The central message was that, for bodily well-being (as well as economic success), men and women had to control and channel their sexual desires toward procreative, marital relations. "Properly channeled, experts claimed, sexual relations promised to contribute to individual health, marital intimacy, and even spiritual joy" (D'Emilio & Freedman 1988, 72). The popularity of these materials demonstrated Americans' need for and interest in sexuality education. Much of the self-help and medical-advice literature directed at men emphasized the dangers of masturbation. Women were taught that they had less sexual passion than men, and their role was to help men to control their sexual drives. In other words, a standard of female "purity" was the major theme of the sexuality education of the time.

Two studies of women's sexuality conducted in the early 1900s provide insight into the sources of sexual information for women during the 19th century. Katharine B. Davis (1929) studied 1,000 women (three quarters born before 1890) and Dr. Clelia Mosher (1980) surveyed 45 women (four fifths born between 1850 and 1880). Over 40% of the women in Davis' study and half in Mosher's reported that they received less-than-adequate instruction about sex before marriage. Those who indicated that they had received some sexual information identified Alice Stockham's advice manual, *Tokology*, about pregnancy, childbirth, and childrearing as their chief source.

In the later 19th century, a combined health and social-reform movement developed that attempted to control the content of and access to sexuality education. Middle-class reformers organized voluntary associations, such as the Women's Christian Temperance Union (WCTU), to address issues, including prostitution and obscenity. The social-purity movement in the late 19th century added the demand for

female equality and a single sexual standard to the earlier moral-reform movements. The WCTU spearheaded a sex-education campaign through the White Cross to help men resist sexual temptation. Social-purity leaders authored marital advice books that recognized women's sexual desires and stressed that women could enjoy intercourse only if they really wanted it. Women's rights and social-purity advocates issued the first formal call for sex education in America. They argued that women should teach children about sex: "Show your sons and daughters the sanctities and the terrors of this awful power of sex, its capacities to bless or curse its owner" (D'Emilio & Freedman 1988, 155). They demanded a public discourse of sexuality that emphasized love and reproductive responsibility rather than lust.

An example of the restricted character of sexuality education at the time was the enactment of the 1873 "Comstock Law" for the "Suppression of Trade in, and Circulation of Obscene Literature and Articles of Immoral Use." This revision of the federal postal law forbade the mailing of information or advertisements about contraception and abortion, as well as any material about sexuality. The Comstock Law was in effect until being overturned by a federal appeals court in 1936 in a decision about contraception: *United States v. Dow Package*.

Yet, the turn of the 19th century ushered in a more "progressive" era fueled by industrial capitalism. Progressive reform provoked by the middle class called upon government and social institutions, including schools, to intervene in social and economic issues, such as sex education. One of the major movements for sex education was the social-hygiene movement spearheaded by Dr. Prince Morrow to prevent the spread of syphilis and gonorrhea. In 1905, he formed the Society of Sanitary and Moral Prophylaxis in New York City, later renamed the American Social Hygiene Association. This society was joined by the WCTU, YMCA, state boards of health, and the National Education Association in an "unrelenting campaign of education to wipe out the ignorance and the prejudices that allowed venereal diseases to infect the nation" (D'Emilio & Freedman 1988, 205). They held public meetings and conferences, published and distributed written materials, and endorsed sex education in the public schools. While insisting on frank and open discussions of sexual-health matters, they promulgated the traditional emphasis of sexuality in marriage for reproductive purposes and the avoidance of erotic temptation (like masturbation). More-conservative Americans considered such openness to be offensive. Former-President Howard Taft described sex education as "full of danger if carried on in general public schools" (D'Emilio & Freedman 1988, 207). Others considered this type of education to be too restrictive. For example, Maurice Bigelow, Professor of Biology at Columbia University Teachers' College, objected to the terms "sex" and "reproduction" being used synonymously. Not until after 1920 would these activists see any progress towards the goal of having some basic sex (reproductive) instruction integrated into any school curriculum.

The early 1900s found American minds being expanded by the writings of Sigmund Freud and Havelock Ellis, among others. These psychologists helped popularize the notion of sexuality as a marker of self-identity and a force permeating one's life, which, if repressed, risks negative consequences. In addition, socialist and feminist ideologies and the industrial economy created an environment fertile for the demand of birth-control information and services. These events spearheaded the second major movement for sexuality education, which was based on social-justice issues, particularly for women and the poor.

In 1912, Margaret Sanger began a series of articles on female sexuality for a New York newspaper, which was confiscated by postal officials for violating the Comstock antiobscenity law. Later, to challenge the constitutionality of this law, she published her own magazine, *The Woman Rebel*, filled with information about birth control. She was charged with nine counts of violating the law, with a penalty of 45 years in prison, after writing and distributing a pamphlet, *Family Limitation*. To avoid prosecution, she fled to Europe; but in her absence, efforts mounted to distribute birth-control information. By early 1915, activists had distributed over 100,000 copies of *Family Limitation*, and a movement for community sexuality education was solidified. Public sentiment in favor of the right to such information was so strong that charges were dropped against Sanger when she returned to America. Community education about and access to birth control, particularly for middle-class women, began to become accepted, if not expected, as a matter of public health, as well as an issue of female equality (social justice).

Premarital experience became a more-common form of sexuality education among the white middle-class, beginning in the 1920s and accelerating as youth became more autonomous from their families (through automobiles, attendance at college, participation in more leisure activities like movies, and war experiences). Dating, necking, and petting among young peers became a norm. "Where adults might see flagrantly loose behavior, young people themselves had constructed a set of norms that regulated their activity while allowing the accumulation of experience and sexual learning" (D'Emilio & Freedman 1988, 261).

Courses on marriage and the family and (sexual) hygiene were being introduced into the college curriculum. Marriage manuals began to emphasize sexual expression and pleasure, rather than sexual control and reproduction, with more-explicit instructions as to how to achieve satisfying sexual relationships (such as "foreplay" and "simultaneous orgasm"). By the end of the 1930s, many marriage manuals were focusing on sexual "techniques." In addition, scientific reports, such as *Sexual Behavior in the Human Male* by Alfred Kinsey and his associates (1948) and the corresponding *Sexual Behavior in the Human Female* (1953), were major popular works primarily read by the middle class. These books provided sexuality education about the types and frequencies of various sexual expressions among white Americans to more than a quarter of a million people. They also are considered landmarks in sexuality education:

What they [Americans] have learned and will learn may have a tremendous effect on the future social history of mankind. For they [Kinsey and colleagues] are presenting facts. They are revealing not what should be, but what is. For the first time, data on human sex behavior is entirely separated from questions of philosophy, moral values, and social customs. (D'Emilio & Freedman 1988, 286)

As scientific information on sexuality became readily available to the American public, more-explicit presentation of sexual material in printed and audiovisual media became possible through the courts' decisions narrowing the definition of obscenity. The proliferation of such sexually explicit materials was encouraged by the expansion of the consumer-oriented economy. For example, advertising was developing into a major industry beginning in the 1920s. Sex was used to sell everything from cars to toothpaste. Gender-role education, in particular, was an indirect outcome of the advertising media. A "paperback revolution" began in 1939, placing affordable materials, such as "romance novels," in drugstores and newsstands all over the country.

In December 1953, Hugh Hefner published the first issue of *Playboy*, whose trademark was a female “Playmate of the Month” displayed in a glossy nude centerfold. The early *Playboy* philosophy suggested males should “enjoy the pleasures the female has to offer without becoming emotionally involved” (D’Emilio & Freedman 1988, 302). By the end of the 1950s, *Playboy* had a circulation of one million, with the readership peaking at six million by the early 1970s. Many a man identified *Playboy* as his first, and perhaps most influential, source of sex education.

By the 1970s, sex manuals had taken the place of marital advice manuals. Popular books, like the 1972 *Joy of Sex* by Dr. Alex Comfort, encouraged sexual experimentation by illustrating sexual techniques. Sexual references became even more prolific in the mainstream media. For example, the ratio of sexual references per page tripled between 1950 and 1980 in magazines, including *Reader’s Digest*, *Time*, and *Newsweek*. In addition, Masters and Johnson’s groundbreaking book, *Human Sexual Response*, emphasizing that women’s sexual desires and responses were equal to those of men, was published in 1966. The media were influencing Americans—female and male, married and single—to consider sexual pleasure as a legitimate, necessary component of their lives.

Yet, even with the explicit and abundant presentation of sexuality in the popular media, parents were still not likely to provide sexuality education to their children, nor were the schools.

In 1964, a lawyer, a sociologist, a clergyman, a family life educator, a public health educator, and a physician came together to form the Sexuality Information and Education Council of the United States (SIECUS). SIECUS is a non-profit voluntary health organization with the aim to help people understand, appreciate, and use their sexuality in a responsible and informed manner. Dr. Mary Calderone was a co-founder and the first executive director. SIECUS soon became known all over the country as a source of information on human sexuality and sex education.

This private initiative for sexuality education was followed by a governmental one in 1966 when the Office of Education of the federal Department of Health, Education, and Welfare announced its newly developed policy supporting

family life and sex education as an integral part of the curriculum from preschool to college and adult levels; it will support training for teachers . . . it will aid programs designed to help parents . . . it will support research and development in all aspects of family life and sex education. (Haffner 1989, 1)

In 1967, a membership organization, first called the American Association of Sex Educators and Counselors, was formed to bring together professionals from all disciplines who were teaching and counseling about human sexuality. The organization later expanded to include therapists, and is known today as the American Association of Sex Educators, Counselors, and Therapists (AASECT). Opposition to sexuality education from conservative political and religious groups grew quickly. In 1968, the Christian Crusade published, “Is the Schoolhouse the Proper Place to Teach Raw Sex?” and the John Birch Society was calling sex education a “Communist plot.” In response, over 150 public leaders joined the National Committee for Responsible Family Life and Sex Education.

In 1970, Maryland became the first state to mandate family-life and human-development education at all levels in their public schools. However, the new “purity” movement by conservatives was under way, coordinating over 300 organizations throughout the country to oppose sex

education in the public schools. Several states passed antisexuality-education mandates, with Louisiana barring sex education altogether in 1968. By the late 1970s, only half-a-dozen states had mandated sex education into their schools, and implementation in the local classrooms was limited.

In 1972, AAASECT began developing training standards and competency criteria for certification of sexuality educators, counselors, and therapists. A list of the professionals who have become certified in these three areas is provided in a published register so that other professionals and consumers can locate people who are trained. (Currently, this list identifies over 1,000 certified professionals.) AAASECT also has developed a code of ethics for professionals working in these fields.

In 1979, the federal government through the Department of Health, Education, and Welfare conducted a national analysis of sex-education programs in the United States. The researchers calculated that less than 10% of all students were receiving instruction about sexuality in their high schools. The report’s overall conclusion stated:

Comprehensive programs must include far more than discussions of reproduction. They should cover other topics such as contraception, numerous sexual activities, the emotional and social aspects of sexual activity, values clarification, and decision-making and communication skills. In addition to being concerned with the imparting of knowledge, they should also focus on the clarifying of values, the raising of self-esteem, and the developing of personal and social skills. These tasks clearly require that sex education topics be covered in many courses in many grades. (Kirby, Atter, & Scales 1979, 1)

When AIDS burst upon the scene in the 1980s, education with the goal of “social protection” from this deadly disease was targeted for inclusion in public-school curricula. In a relatively short time, most states came to require, or at least recommend, that AIDS education be included in school curricula. The number of states mandating or recommending AIDS education surpassed those mandating or recommending sexuality education. Money and other resources were being infused into AIDS-education initiatives. For example, in 1987-88, 80% of the \$6.3 million spent nationwide on sexuality education went specifically to AIDS-education efforts. Today, policies and curricula addressing AIDS tend to be much more specific and detailed than those dealing with other aspects of sexuality education, including pregnancy prevention. This may lead to students receiving a narrow and negative view of human sexuality (e.g., “sex kills!”).

Throughout this time, SIECUS remained committed to comprehensive sexuality education, as emphasized in its mission statement: “SIECUS affirms that sexuality is a natural and healthy part of living and advocates the right of individuals to make responsible sexual choices. SIECUS develops, collects, and disseminates information and promotes comprehensive education about sexuality” (Haffner 1989, 4). In 1989, SIECUS convened a national colloquium on the future of sexuality education, “Sex Education 2000,” to which 65 national organizations sent representatives. The mission was to assure that all children and youth receive comprehensive sexuality education by the year 2000. Thirteen specific goals for the year 2000 were set forth as follows:

1. Sexuality education will be viewed as a community-wide responsibility.
2. All parents will receive assistance in providing sexuality education for their child(ren).

3. All schools will provide sexuality education for children and youth.
4. All religious institutions serving youth will provide sexuality education.
5. All national youth-serving agencies will implement sexuality education programs and policies.
6. The media will assume a more proactive role in sexuality education.
7. Federal policies and programs will support sexuality education.
8. Each state will have policies for school-based sexuality education and assure that mandates are implemented on a local level.
9. Guidelines, materials, strategies, and support for sexuality education will be available at the community level.
10. All teachers and group leaders providing sexuality education to youth will receive appropriate training.
11. Methodologies will be developed to evaluate sexuality education programs.
12. Broad support for sexuality education will be activated.
13. In order to realize the overall goal of comprehensive sexuality education for all children and youth, SIECUS calls upon national organizations to join together as a national coalition to support sexuality education (SIECUS 1990).

To aid in the attainment of the third goal of providing comprehensive sexuality education in the schools, a national Task Force with SIECUS's leadership published *Guidelines for Comprehensive Sexuality Education, Kindergarten Through 12th Grade* in 1991. These guidelines, based on six key concepts, provide a framework to create new sexuality-education programs or improve existing ones. The guidelines are based on values related to human sexuality that reflect the beliefs of most communities in a pluralistic society. They represent a starting point for curriculum development at the local level. Currently, another Task Force is working on ways to help providers of preschool education incorporate the beginnings of comprehensive sexuality education into their programs. In 1994, SIECUS also launched an international initiative in order to disseminate information on comprehensive sexuality education to the international community and to aid in the development of specific international efforts in this area.

Yet, in light of progress that has been made, challenges to sexuality programs from conservative organizations have become more frequent, more organized, and more successful than ever before (Sedway 1992). These nationally organized groups, including Eagle Forum, Focus on the Family, American Family Association, and Citizens for Excellence in Education, target local school programs that do not conform to their specific ideology. They attempt to control what others can read or learn, not just in sexuality education (which now is the major target), but in all areas of public education, including science (with the teaching of creationism), history, and literature (with censorship of many classics in children's literature). Although these groups represent a minority of parents in a school district, through well-organized national support, they often effectively use a variety of intimidating tactics to prevent the establishment of sexuality-education programs altogether or establish abstinence-only ones. Their tactics include personal attacks on persons supporting comprehensive sexuality education, threatening and sometimes pursuing costly litigation against school districts, and flooding school boards with misinformation, among other strategies. The greater impact of this anti-sexuality-education campaign

on education, in general, and American society, overall, has been poignantly described:

In another sense, the continuing series of attacks aimed at public education must be viewed in the context of the larger battle—what has come to be known as a “Cultural Civil War”—over free expression. Motion pictures, television programs, fine art, music lyrics, and even political speech have all come under assault in recent years from many of the same religious right leaders behind attacks on school programs. In the vast majority of cases, in the schools and out, challengers generally seek the same remedy, i.e., to restrict what others can see, hear, or read. At stake in attacks on schoolbooks and programs is students' exposure to a broad spectrum of ideas in the classroom—in essence, their freedom to learn. And when the freedom to learn is threatened in sexuality education, students are denied information that can save their lives. (Sedway 1992, 13-14)

## **B. Current Status of Sexuality Education**

### *Youth-Serving Agencies*

National youth-serving agencies (YSAs) in the United States provide sexuality education to over two million youths each year. Over the past two decades, YSAs began developing such programs, primarily in response to the problems of adolescent pregnancy and HIV/AIDS.

Second only to schools in the number of youth they serve, youth-serving agencies are excellent providers of sexuality education programs, both because they work with large numbers of youth, including many underserved youth, and because they provide an environment that is informal and conducive to creative and experiential learning. Some YSAs reach youth who have dropped out of school. Others reach youth who have not received sexuality education programs in their schools. The people who work at YSAs often build close relationships with the youth in their programs which allows for better communication and more effective educational efforts. (Dietz 1989/1990, 16)

For example, the American Red Cross reaches over one million youth each year in the U.S. with their “AIDS Prevention Program,” “Black Youth Project,” and “AIDS Prevention Program for Hispanic Youth and Families.” The Boys Clubs of America has developed a substance abuse/pregnancy prevention program, called “Smart Moves.” The Girls Clubs of America has a primary commitment to providing health promotion, sexuality education, and pregnancy-prevention services to its members and reaches over 200,000 youth each year. The Girl Scouts of the U.S.A. developed a curriculum, “Decision for Your Life: Preventing Teenage Pregnancy,” that focuses on the consequences of teen parenthood and the development of communication, decision-making, assertiveness, and values-clarification skills. The March of Dimes Birth Defects Foundation developed the “Project Alpha” sexuality-education program that explores teenage pregnancy from the male perspective and helps young men learn how to take more responsibility. The National Network of Runaway and Youth Services has developed an HIV/AIDS education program for high-risk youth, called “Safe Choices.” The program provides training for staff at runaway shelters, residential treatment facilities, detention facilities, group homes, street outreach programs, hotlines, foster-family programs, and other agencies that serve high-risk youth.

In addition to the national efforts of YSAs, many local affiliates have designed their own programs to meet the needs of their local communities in culturally sensitive ways. For example, the National 4-H Council estimates that most state extension offices have developed their own programs to reduce teenage pregnancy in their areas.

**Table 7****State Requirements for Sexuality, STD, and HIV/AIDS Education in Primary and Secondary Schools****Sexuality Education—Required from Kindergarten Through Senior High School**

Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Illinois, Iowa, Kansas, Maryland, Minnesota, Nevada, New Jersey, New Mexico, North Carolina, Rhode Island, Tennessee, Vermont, Virginia, and West Virginia

**Sexuality Education—Required for Grades 5 or 6 Through Senior High School**

South Carolina, Texas, and Utah

**Sexuality Education—Not Required**

Alaska, Arizona, California, Colorado, Connecticut, Hawaii, Idaho, Indiana, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New York, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Washington, Wisconsin, and Wyoming

**STD/HIV/AIDS Education—Required from Kindergarten Through Senior High School**

Alabama, Arizona, Arkansas, Connecticut, Delaware, District of Columbia, Florida, Georgia, Idaho, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island,<sup>1</sup> Tennessee,<sup>2</sup> Vermont, Virginia, Washington, and Wisconsin

**STD/HIV/AIDS Education—Required Grades 5 or 6 Through Senior High School**

California, Illinois, Maryland, Oklahoma, South Carolina, Texas, Utah,<sup>3</sup> and West Virginia

**STD/HIV/AIDS Education—Not Required**

Alaska, Colorado, Hawaii, Kentucky, Louisiana,<sup>4</sup> Maine, Massachusetts, Mississippi, Montana, Nebraska, North Dakota, South Dakota, and Wyoming

<sup>1</sup>Instruction in sexuality and HIV/AIDS is required at least once a year in all grades.

<sup>2</sup>Instruction in sexuality and HIV/AIDS is required only in counties with more than 19.5 pregnancies per 1,000 females aged 15 to 17. Only one county did not meet this standard.

<sup>3</sup>HIV/AIDS education is required from 3rd to 12th grades.

<sup>4</sup>Louisiana law prohibits sex education before the 7th grade, and in New Orleans, before the 3rd grade.

Source: *Sexuality Education in America: A State-by-State Review* (NARAL/The NARAL Foundation 1995).

**Schools**

More than 85% of the American public approve of sexuality education being provided in the schools, compared with 76% in 1975 and 69% in 1965 (Kenney, Guardado, & Brown 1989). Today, roughly 60% of teenagers receive at least some sex education in their schools, although only a third receive a somewhat “comprehensive” program.

Each state can mandate or require that sexuality education and/or AIDS education be provided in the local school districts. Short of mandating such educational programs, states may simply recommend that the school districts within their boundaries offer education on sexuality, in general, and/or more-specific AIDS education. In 1992, 17 states had mandated sexuality education and 30 more recommended it; see Table 7 (Haffner 1992). In addition, 34 states had mandated AIDS education, while 14 more recommended it. Only four states (Massachusetts, Mississippi, South Dakota, and Wyoming) had no position on sexuality education within their schools, whereas Ohio, Wyoming, and Tennessee had no position on AIDS education. In 1995, NARAL and the NARAL Foundation (1995) issued a detailed state-by-state review of sexuality education in America with selected details of legislative action in 1994 and 1995.

Although the majority of states either mandate or recommend sexuality and AIDS education, this does not guarantee that local school districts are implementing the suggested curricula. Inconsistencies in and lack of implementation of these curricula result from: absence of provisions for mandate enforcement, lax regulations regarding compliance, diversity in program objectives, restrictions on course content, lack of provisions for teacher training, and insufficient evaluation.

In 1988, SIECUS conducted a project to examine and evaluate the recommended state sexuality and AIDS-education curricula (di Mauro 1989-90). Of the 23 state curricula that they evaluated for sexuality education, only 22%

were deemed to be accurate. Although most curricula stated that human sexuality is natural and positive, there was a lack of any content in the curricula to support this concept. Most focused on the negative consequences of sexual interaction, and little attention was paid to the psychosocial dimensions of sexuality, such as gender identification and roles, sexual functioning and satisfaction, or values and ethics. Only one half of the curricula provided thorough information about birth control.

In an evaluation of the 34 state-recommended AIDS-education curricula, 32% were found to be accurate in basic concepts and presentation. The majority (85%) emphasized abstinence and “just say no” skills, whereas only 9% covered safer sex as a preventive practice. Thorough information about condoms was provided in less than 10% of the curricula. There was no mention of homosexuality in over one third of the curricula. In 38%, homosexuals were identified as the “cause of AIDS.” The Utah curriculum was especially negative and restrictive:

Utah’s teachers are not free to discuss the “intricacies of intercourse, sexual stimulation, erotic behavior”; the acceptance of or advocacy of homosexuality as a desirable or acceptable sexual adjustment or lifestyle; the advocacy or encouragement of contraceptive methods or devices by unmarried minors; and the acceptance or advocacy of “free sex,” promiscuity, or the so-called “new morality.” This section of their curriculum is replete with warnings of legal violations for instructors crossing prohibition lines; their guidelines indicate that with parental consent it is possible to discuss condom use at any grade level, but without it, such discussions are Class B misdemeanors. (di Mauro 1989-90, 6; see also the discussion of Mormon sexuality in Section 2A.)

Currently, a broad focus on sexuality education is being supplanted by a narrow focus on AIDS education. Sexuality

and AIDS education are being treated independently with separate curricula and teacher training. The report concluded that: "What is needed [for each state] is a comprehensive sexuality education or family-life education curriculum with an extensive AIDS education component that contextualizes preventive information within a positive, life-affirming approach to human sexuality" (di Mauro 1989-90, 6).

Yet, recommended curriculum content cannot automatically be equated with what is actually being taught in the classroom. To determine what is being taught, a study of public school teachers in five specialty areas (health education, biology, home economics, physical education, and school nursing) in grades 7 through 12 was conducted (Forrest & Silverman 1989). It was estimated that, nationwide, 50,000 public school teachers were providing some type of sexuality education in grades 7 through 12 in 1987-88, representing 45% of the teachers employed in those areas. Roughly 38.7 hours of sex education were being offered in grades 7 through 12, with 5.0 hours devoted to birth control and 5.9 hours covering STDs.

The teachers cited the encouragement of abstinence as one of their primary goals. The messages that they most want to give included: responsibility regarding sexual relationships and parenthood, the importance of abstinence and ways of resisting pressures to become sexually active, and information on AIDS and other STDs. The teachers agreed that sexuality education belongs in the schools and that students should be taught to examine and develop their own values about sexual behaviors. They reported that there is often a gap between what should be taught, and when and what actually is allowed to be taught. The largest gap concerned sources of birth-control methods; 97% of the teachers believed they should be allowed to provide information to students about where they could access birth control, but this was allowed in less than half of their schools. In fact, one quarter of the teachers were permitted to discuss birth control with students only when they are asked a student-initiated question. In addition, over 90% of the teachers believed that their students should be taught about homosexuality and abortion, topics that are often restricted by school districts. In addition, the teachers believed that the wide range of sexuality topics should be addressed with students no later than 7th or 8th grade; however, this is not usually done until 10th through 12th grades, if at all.

The teachers described many barriers to implementing quality sexuality education in their classrooms. The major problem that they identified was opposition or lack of support from parents, the community, or school administrators. They also felt that they lacked appropriate materials because of the difficulties in getting current relevant materials approved for use. They also encountered student-related barriers, such as discomfort, lack of basic knowledge of anatomy and physiology, and misinformation, poor attitudes, and a lack of values and morals reflecting favorable attitudes toward teen pregnancy. Teachers also lacked enough time and training to teach the material effectively. Almost none of them were certified as sexuality or family-life educators by the American Association of Sex Educators, Counselors, and Therapists or the National Council on Family Relations. The level of the teachers' own knowledge on sexual topics was questionable, and some experienced personal conflicts in dealing with certain issues. The authors concluded that:

Perhaps the most important step toward improved sex education would be increased, clear support of the teachers. One form this support should take is the development of curricula that provide teachers with constructive, planned ways to raise and deal with the topics on their students'

minds, since the data indicate that students will often raise topics even if they are not in the curriculum. Greater support should also help increase the availability of high-quality instructional materials and on-going education and information for teachers. Adequate teaching materials and support for teaching in earlier grades the topics students want to know about might help solve the problem of student inattention and negative reactions, to say nothing of helping with the problems of teenage pregnancy and the spread of AIDS and other STDs. (Forrest & Silverman 1989, 72)

Yet, in recent years, well-organized conservative organizations throughout the United States have been promoting the adoption of their own abstinence-only curricula in the public schools. Since 1985, the Illinois Committee on the Status of Women has received \$1.7 million in state and federal funds to promote such a curriculum, called *Sex Respect*. They have been successful in having *Sex Respect* adopted in over 1,600 school systems, even though this curriculum is designed to proselytize a particular conservative sexual-value system. The *Sex Respect* curriculum has been criticized because it:

- (1) substitutes biased opinion for fact; (2) conveys insufficient and inaccurate information; (3) relies on scare tactics; (4) ignores realities of life for many students; (5) reinforces gender stereotypes; (6) lacks respect for cultural and economic differences; (7) presents one side of controversial issues; (8) fails to meaningfully involve parents; [and] (9) is marketed using inadequate evaluations. (Trudell & Whatley 1991, 125)

Careful scientific evaluation of over 40 sexuality- and AIDS-education curricula commissioned separately by the Centers for Disease Control and the World Health Organization resulted in the following conclusions:

1. Comprehensive sexuality and HIV/AIDS-education programs do not hasten the onset of intercourse nor increase the number of partners or frequency of intercourse.
2. Skill-based programs can delay the onset of sexual intercourse and increase the use of contraception, condoms, and other safer-sex practices among sexually experienced youth.
3. Programs that promote both the postponement of sexual intercourse and safer-sex practices are more effective than abstinence-only programs, like *Sex Respect* (Haffner 1994).

#### [Abstinence-Only Sexuality Education

PATRICIA BARTHALOW KOCH

[Update 1998: Under the 1996 Welfare Reform Law, funds were made available to the states to establish programs that have as their "exclusive purpose" the "promotion of abstinence-only education." Funding of \$50 million a year is guaranteed for these programs for the next five years. To qualify for a federal grant, a state abstinence-only program must teach:

1. The social, psychological, and health gains to be realized by abstaining from sexual activity;
2. Abstinence from sexual activity outside marriage as the expected standard for all school-age children;
3. Abstinence from sexual activity is the only certain way to avoid out-of-wedlock pregnancy, STDs, and other associated health problems;
4. A mutually faithful monogamous relationship in the context of marriage is the expected standard of human sexuality;

5. Sexual activity outside of the context of marriage is likely to have harmful psychological and physical effects;
6. Bearing children out-of-wedlock is likely to have harmful consequences for the child, the child's parents, and society;
7. How to reject sexual advances, and how alcohol and drug use increase vulnerability to sexual advances; and
8. The importance of attaining self-sufficiency before engaging in sexual activity.

[All 50 states have submitted abstinence-only education proposals; many of them are school-based. Yet, national and worldwide research have found abstinence-only programs to be considerably less effective, if effective at all, when compared with comprehensive sexuality education programs, in preventing unintended pregnancy and STDs among youth (Brick & Roffman 1993; Nelson 1996). Yet, no federal funding is forthcoming to support comprehensive sexuality education.

[It is safe to predict that the trend of increasing sexual experience among adolescents will continue, and that young people will not respond favorably to these abstinence-only programs. Perhaps when the general public realizes the ineffectiveness of these programs, greater support for and expansion of more comprehensive sexuality education will result. (End of update by P. B. Koch)]

### C. Informal Sources of Sexual Knowledge

Researchers over the past 50 years have consistently found that adolescents identify peers, particularly of their same gender, as their primary source of sexuality education, followed by various types of media, including print and visual media. Parents and schools are usually identified as significantly less-influential sources.

#### *Peers as a Sexual Information Source*

Males seem to be more dependent on peers for their sexuality education than are females. One problematic aspect of receiving sexuality education informally from peers is that the information they provide is often inaccurate. However, when peers are formally trained to provide sexuality education, such as on the high school or college level, they are very effective in providing information and encouraging the development of positive attitudes towards responsible and healthy sexual expression. Thus, the peer model is being used more widely in school and community sexuality-education programs.

#### *The Media*

The various media are pervasive and influential sources of sexuality education in American culture. Media have been identified by adolescents and college students as being more influential than their families in the development of their sexual attitudes and behaviors. As to television, the radio, and movies, adolescents spend more time being entertained by the media than any other activity, perhaps with the exception of sleeping (Haffner & Kelly 1987).

Television, in particular, has been identified as the most influential source of sexual messages in American society, even though sexual behavior is not explicitly depicted. Yet, in an analysis of the sexual content of prime-time television programming, about 20,000 scenes of suggested sexual intercourse and other behaviors, and sexual comments and innuendos were documented in one year (Haffner & Kelly 1987). These portrayals of sexual interaction are six times more likely to happen in an extramarital, rather than a marital, relationship. In soap operas, 94% of the sexual encounters happen between people who are not married to one another.

Minority groups are extremely underrepresented on TV, with gay and lesbian characters nearly nonexistent.

In the United States, by the time a child graduates from high school, she or he will have spent more time watching TV than being in a formal classroom setting. There is conflicting evidence as to the impact media portrayals have on youth's developing sexuality (Haffner & Kelly 1987). Gender-role stereotyping is a pervasive aspect of television programming, with children who watch more TV demonstrating more stereotypic gender-role behaviors than those who watch less. Some studies have linked young people's television-viewing habits, including the watching of music videos, to the likelihood that they would engage in sexual intercourse, while others have not supported this relationship. Yet, there is no denying that TV serves as a sexuality educator. Adolescents report that TV is equally or more encouraging about engaging in sexual intercourse than are their friends, and those that have high TV-viewing habits are likely to be dissatisfied about remaining virgins. In addition, those who believe that TV accurately portrays sexual experiences are more likely to be dissatisfied with their own.

Soap operas are one of the most popular television genres. Depictions of sexual behaviors are common. Yet, television censors still establish rules, such as not showing unbuttoned clothes or the characters at the moment of "penetration." Unfortunately, very few references to or depictions of safer sex are part of television programs. As the National Academy of Sciences concluded, the media provide "young people with lots of clues about how to be sexy, but . . . little information about how to be sexually responsible" (Haffner & Kelly 1987, 9).

Sexuality has become a focal point of some newer types of television programming. Sexual topics, such as teenage pregnancy, incest, or AIDS, are often the subject matter of made-for-TV movies and "after-school specials." In addition, the "sexually unconventional," such as transvestites, sex addicts, or bigamists, are often the guests of television talk shows, such as Donahue, Oprah, and Geraldo. Some critics believe that this diversity has encouraged viewers to become more tolerant and open, whereas others believe it has done the opposite, reinforcing negative and hostile attitudes. Among adolescents and young adults, music videos have become one of the most popular forms of television entertainment. Yet, context studies of these music videos indicate that women tend to be treated as "sex objects." Madonna is one exception, depicting a powerful image of female sexuality.

The motto that "Sex Sells" has been generously applied to television advertising. Television uses sexual innuendos and images to sell almost every product from toothpaste to automobiles. The most sexually explicit commercials are generally those for jeans, beer, and perfumes. Paradoxically, commercials and public service announcements for birth control methods are banned from television. Those for "feminine hygiene" products and the prevention of sexually transmissible diseases, including AIDS, are quite restricted.

Subscriber cable television offers more sexually oriented programming, such as the *Playboy Channel*, than does network TV. However, the *Exxtacy Channel* was forced out of business because of numerous government obscenity prosecutions. Virtual-reality technology is being developed to allow cable subscribers to use goggles, gloves, and body sensors to enjoy their own virtual sexual reality.

Filmmaking is a huge business and American films are marketed worldwide. Movies have been reported as one of the leading sources of sexual information for adolescent Anglo-American, Latino, and Native American males (Davis & Harris 1982). Films are given greater license to depict sexual behavior explicitly than on television; however, they are

still censored. In fact, films, such as *Basic Instinct*, have more explicit sex in their uncut versions that are marketed abroad than the “cut” versions that are marketed domestically. Female nudity has become acceptable, whereas male frontal nudity is still censored. Sexual behaviors other than heterosexual intercourse tend to be missing from most films.

Videocassettes and videocassette recorders (VCRs) have revolutionized the viewing habits of Americans. Two hundred million X-rated videocassettes were rented in the U.S. in 1989. One study of college students determined that males viewed about six hours and females two hours of sexually explicit material on their VCRs a month (Strong & DeVault 1994).

Another very popular form of media, directed at females, is the romance novel, comprising 40% of all paperback book sales in the U.S. Romance novels are believed to both reflect and create the sexual fantasies and desires of their female American audience. The basic formula of this form of media is: “Female meets devastating man, sparks fly, lovers meld, lovers are torn apart, get back together, resolve their problems, and commit themselves, usually, to marriage” (Strong & DeVault 1994, 22).

Sexual language is disguised by euphemisms. For example, the male penis is referred to as a “love muscle” and the female vagina as a “temple of love.” Yet, romance novels are filled with sensuality, sexuality, and passion, with some people considering them softcore pornography.

Young males in the U.S. tend to learn about sexuality through more-explicit magazines, such as *Playboy* and *Penthouse*. *Playboy* is one of the most popular magazines worldwide, selling about 10 million issues monthly. Half of college men, but much fewer women, report that pornography has been a source of information for them regarding sexual behaviors (Duncan & Nicholson 1991).

Finally, with increased public access to computer technology, sexuality education is now being offered through the computer-based superhighway. This represents the “wave of the future” and is thoroughly discussed later in this chapter.

#### *Parents as a Source of Sexual Information*

It is widely believed that parents should be the primary sexuality educators of their children. They certainly provide a great deal of indirect sexuality education to their children through the ways that they display affection, react to nudity and bodies, and interact with people of different genders and orientations—as well as the attitudes they express (or the lack of expression) towards a myriad of sexual topics.

However, most parents in the United States provide little direct sexuality education to their children, even though the majority of children express the desire to be able to talk to their parents about sexuality. Studies of American adolescents consistently find that up to three quarters state that they have not discussed sexuality with their parents (Hass 1979; Sorenson 1973). Parents have expressed the following as barriers to discussing sexuality with their children: anxiety over giving misinformation or inappropriate information for the developmental level of their children; lack of skills in communicating about sexuality, since very few parents ever had role models on how to handle such discussions; and fear that discussing sexuality with their children will actually encourage them to become involved in sexual relationships.

When sexuality education occurs in the home, the mother is generally the parent who handles such discussions with both daughters and sons. Studies do indicate that, when parents talk to their children about sexuality, the children are more likely to wait to become involved in sexual behaviors until they are older, than those children who have not talked with their parents (Shah & Zelnick 1981). Further, when par-

ent-educated teens do engage in sexual intercourse, they are more likely to use an effective means of birth control consistently and to have fewer sexual partners. In addition, high family sexual communication seems to be related to similarity in sexual attitudes between parents and their children.

Recognizing the importance of having parents involved in their children’s sexuality education, efforts are being made to prepare parents to become better sexuality educators. Sexuality-education programs for parents are offered separate from, and in conjunction with, children’s programs in some schools, and through some community and religious organizations. The goals of these programs include developing parents’ communication skills so that they can become more “askable,” increasing their knowledge about various aspects of sexuality, and exploring their attitudes and values surrounding these issues. For example, the National Congress of Parents and Teachers’ Associations (PTA) has created programs and publications on aspects of sexuality and HIV/AIDS prevention for use by local affiliates.

It is clear that we must continue to strive to reach all Americans with positive and comprehensive sexuality education through all of our available informal and formal channels. It is also imperative that sound qualitative and quantitative research methodologies be used to ascertain the impact of differing sexuality education strategies and sources on the diverse groups of people—e.g., gender, age, orientation, race, and ethnicity—in the United States.

#### **ID. Sexuality Education 2003 Update**

WILLIAM TAVERNER

[Update 2003: In 1996, the United States Congress authorized, and President Bill Clinton approved, approximately \$100 million in annual spending for “abstinence-until-marriage” education programs. These programs attempt to establish “sexual abstinence” as the social standard for American teens and, in fact, for any unmarried American. Programs in states that accept these federal funds are prohibited from teaching the effectiveness of other methods of contraception and prevention from sexually transmitted infections. To the contrary, such programs often overstate the failure of these effective methods since the programs are not required to be based upon medically accurate research.

[There is currently no evidence that “abstinence-only” education programs are effective in reducing teen sexual activity, sexually transmitted infections, pregnancy, or in yielding any measurable outcome in the health of teens. There is, however, ample research that illustrates the characteristics of sexuality education programs that are effective. According to *The National Campaign to Prevent Teen Pregnancy Report* (Kirby 2001), the most effective sex and HIV education programs share 10 common characteristics. These curricula and programs:

1. Focus on reducing one or more sexual behaviors that lead to unintended pregnancy or HIV/STD infection.
2. Are based on theoretical approaches that have been demonstrated to influence other health-related behavior and identify specific important sexual antecedents to be targeted.
3. Deliver and consistently reinforce a clear message about abstaining from sexual activity and/or using condoms or other forms of contraception. This appears to be one of the most important characteristics that distinguish effective from ineffective programs.
4. Provide basic, accurate information about the risks of teen sexual activity and about ways to avoid intercourse or use methods of protection against pregnancy and STDs.

**Table 8****Principles for Sexuality Education**

- 1. YOUNG PEOPLE NEED AND DESERVE RESPECT.** This respect includes an appreciation for the difficulty and confusion of the teen years and a recognition of the constellation of factors that has contributed to the problems teens face. It means treating them as intelligent and capable of making changes in their lives.
- 2. TEENS NEED TO BE ACCEPTED WHERE THEY ARE.** This means listening and hearing what young people have to say, though we as adults might disagree. In general, we are much better off helping teens explore the possible pitfalls of their attitudes rather than moralistically telling them what they ought to believe.
- 3. TEENS LEARN AS MUCH OR MORE FROM EACH OTHER AS FROM ADULTS.** Often, if we let young people talk, allow them to respond to each other's questions and comments and ask for their advice, they feel empowered and take responsibility for their own learning. It is much more powerful for a peer to challenge another teen's attitude than for an adult to do so.
- 4. EXPLICIT INFORMATION AND COMMUNICATION ABOUT SEXUALITY IS ESSENTIAL.** For most of their lives young people have gotten the message that sex is hidden, mysterious and something you should not talk about in a serious and honest way. Limiting what teens can talk about and using vague terminology perpetuates the "secrecy" of sex.
- 5. A POSITIVE APPROACH TO SEXUALITY EDUCATION IS THE BEST APPROACH.** This means moving beyond talking about the dangers of sex and acknowledging in a balanced way the pleasures of sex. It means associating things open, playful, and humorous with sexuality rather than only things grave and serious. It means offering a model of what it is to be sexually healthy rather than focusing on what is sexually unhealthy.
- 6. YOUNG PEOPLE HAVE A FUNDAMENTAL RIGHT TO SEXUALITY EDUCATION.** They have a right to know about their own bodies and how they function. They have a right to know about the sexual changes that are occurring now and that will continue throughout their lifetimes. They have the right to have their many questions answered. People who have explored their own values and attitudes and have accurate information are in the best position to make healthy decisions about their sexual lives.
- 7. GENDER EQUALITY AND GREATER FLEXIBILITY IN SEX-ROLE BEHAVIOR LET ALL YOUNG PEOPLE REACH THEIR FULL POTENTIAL.** We strongly advocate the right of every young person, whether male or female, to achieve her/his full human potential. Strict adherence to traditional gender-role behavior limits people's choices and restricts their potential. Flexible gender-role behavior is fundamental to personal and sexual health in all its dimensions.
- 8. ALL SEXUAL ORIENTATIONS AND GENDER IDENTITIES MUST BE ACKNOWLEDGED.** We must recognize the reality that some adolescents are, or think they may be lesbian, gay, bisexual, or transgender. It is important to create an environment that recognizes the needs of these often isolated and invisible youth. Teaching frankly about sexual orientation also benefits heterosexual youth because it allays fears about same-sex feelings that many of them experience.
- 9. SEX IS MORE THAN SEXUAL INTERCOURSE.** This means teaching young people that there are many ways to be sexual with a partner besides intercourse and most of these behaviors are safer and healthier than intercourse. The word "sex" often has a vague meaning. When talking about intercourse, the word "intercourse" is used.

5. Include activities that address social pressures that influence sexual behavior.
6. Provide examples of and practice with communication, negotiation, and refusal skills.
7. Employ teaching methods designed to involve participants and have them personalize the information.
8. Incorporate behavioral goals, teaching methods, and materials that are appropriate to the age, sexual experience, and culture of the students.
9. Last a sufficient length of time (i.e., more than a few hours).
10. Select teachers or peer leaders who believe in the program and then provide them with adequate training (Reprinted with permission; Kirby 2001).

[Later in 2001, the U.S. Surgeon General released a report detailing the necessity for a comprehensive approach to sexuality education. Citing the alarmingly high rates of sexually transmitted infections and unplanned pregnancies among Americans, Surgeon General David Satcher indicated that the United States needs to provide "evidence-based intervention models" for education, including accurate information about contraception and prevention of sexually transmitted infections (Satcher 2001).

[Americans overwhelmingly echoed their support for comprehensive sexuality education. Over 80% of Ameri-

cans support education that teaches abstinence, pregnancy, and prevention from sexually transmitted infections (Daillard 2001). Polling by the Kaiser Family Foundation found even greater support among American parents. Ninety percent of parents want schools to teach their children about birth control (Kaiser 2000) and 85% want their children to learn about condoms (Kaiser 2000). Lost in the picture are teens who become sexually active, often without having the knowledge or skills to prevent pregnancy or infection. Sexual activity among young Americans often precedes sexuality education. Almost half of teen males, for example, report having had intercourse before learning how to say no to sex in school (Daillard 2001).

[Despite the lack of research for abstinence-only education, the calls for comprehensive sexuality education among parents and experts, and the reality of teen sexual activity, President George W. Bush's 2003 budget actually increased funding for abstinence-only education by \$85 million (White House, February 2002).

#### *[Who Does the Real Sex Ed?*

[Table 8 lists the key philosophical principles for sexuality education developed by the Center for Family Life Education (CFLE), part of Planned Parenthood of Greater Northern New Jersey. CFLE publishes many of the education man-

uals used by sexuality educators inside and outside of the organization, and in many other parts of the world. The organization is an affiliate of the national Planned Parenthood. With a current staff of 820 sexuality educators and 700 volunteers working in 127 affiliates nationwide, Planned Parenthood has provided over 1.5 million sexuality education programs, making it the largest network of sexuality educators in the country. Planned Parenthood educators have an impact on Americans of all ages, and on a substantial range of topics, including abstinence, contraception, safer sex, sexual harassment, sexual orientation, and more.

[Other major organizations that support and advocate for comprehensive sexuality education include Advocates for Youth, the American Association of Sex Educators, Counselors, and Therapists, the National Campaign to Prevent Teen Pregnancy, the Network for Family Life Education, and the Sexuality Information and Education Council of the United States (SIECUS). The SIECUS website, <http://www.siecus.org>, has a list of the nearly 150 national service and professional organizations that are a part of the National Coalition to Support Sexuality Education).

[Inside the classroom, many “sexuality educators” have a limited amount of time to actually teach about sexuality; 71% of sexuality educators acknowledged that they spend less than a quarter of their time teaching sexuality education, and the majority identify “health” as their main subject area (Kaiser 2000). The time classroom educators do spend on sexuality tends to focus on abstinence, much more so than they did 20 years ago (Darroch 2000). Today, 33% of U.S. school districts have no specific policy on sexuality education, 57% promote abstinence as either the *only* option, or as the *preferred* option, leaving only 10% of school districts that teach abstinence as one option in a broader education program (Landry 1999). Classroom teachers may be feeling the impact of political restrictions on what they can and cannot say. More than 9 in 10 teachers believe students should be taught about contraception, but many feel restricted from doing so (Darroch 2000). In other subjects, teachers report a considerable gap between what they *think* young people need to learn and what they actually teach. Almost 80% of school educators think that students should learn about sexual orientation, but just over half spend any time teaching about it. And, almost 90% think students should learn facts about abortion, but 30% fewer actually spend time teaching about this controversial subject.

[The picture becomes even more interesting when one asks young people what *they think* is being taught in the classroom. When teachers and students are asked about what subjects were or were not covered in sexuality education, they report very differently. For example, 95% of teachers report having taught their students “how to deal with the pressure to have sex,” but only 79% percent of students report having learned this; 86% of teachers say they taught students how to get tested for HIV and other STDs, but only 69% of students say they were taught this. And, while 78% of teachers said they taught about what to do when “you or a friend has been sexually assaulted,” only 59% of students say this information was given to them (Kaiser 2000). Clearly, there is a disconnect between what teachers say they are teaching and what students say they are learning.

[The gap widens when one examines what American parents want their children to learn, versus what their children report having actually learned in the classroom. Strikingly, 97% of parents want their children to learn “how to talk with their parents,” but only 62% of students report having learned this; 76% of parents want their children to learn about sexual orientation, but only 41% of students say this is taught. (See Table 9 for an excerpted summary of the

gap between parental expectations and the reality that their children report.)

[When students are asked what subjects they need *more* information about, over half say that they need to know what to do in the case of rape or sexual assault and more information about HIV and other STDs. Moreover, 40% say they need to learn skills for talking to a partner about birth control and STDs, and how to deal with the emotional consequences of being sexually active. Evidently, learning about abstinence is not enough. (*End of update by W. Taverner*)]

#### 4. Autoerotic Behaviors and Patterns

ROBERT T. FRANCOEUR\*

##### A. Research Weaknesses and Challenges

Five weaknesses or shortcomings and three challenges can be identified in the current research on autoerotic attitudes and behavior patterns in the U.S.A. The weaknesses are:

1. the virtual absence of recent data on noncollege men and women, especially married women and men;
2. the small sample sizes in available research;
3. a problem with the representativeness of the samples;
4. very limited or no data on African-Americans, Latinos, and other ethnic/racial groups; and
5. a limited use of theory as a driving force in the development of research questions.

The challenges include:

1. finding available research funds;
2. overcoming the negative views in academia toward sex research in general, and especially for research on masturbation; and
3. disseminating the findings to the “consumer” to relieve the guilt feelings that many persons experience as a result of their masturbation practices.

##### B. Children and Adolescents

In 1985, Mary Calderone, M.D., a pioneer of American sexology and cofounder of the Sexuality Information and Education Council of the United States, documented the presence of a functioning erectile reflex in a 17-week-old male fetus. Considering the homologies of the male and female genital systems, it is logical to assume that females also develop the capacity for cyclical vaginal lubrication while still in the womb. In a 1940 study of boys three to 20 weeks old, seven of nine infants had erections from five to 40 times a day. Seven-month-old girls have been observed experiencing what to all appearances can only be judged to

**Table 9**

#### The Gap Between What Parents Want and Schools Teach

Selected Topics	What parents want sex ed to teach	What students say is taught
What to do if raped	97%	59%
How to talk with parents	97	62
How to use and where to get birth control	84	59
Abortion	79	61
Sexual orientation/homosexuality	76	41

Source: Kaiser Family Foundation 2000. *Sex Education in America: A View from Inside the Nation's Classrooms*.

\*With input from J. Kenneth Davidson, Sr.

be a reflexive orgasm induced by rubbing or putting pressure on their genitals.

The natural reflexes that result in fetal and infant erections and vaginal lubrication are very much like the knee jerk and other reflexes, except that they are accompanied by smiles and cooing that clearly suggest the infant is enjoying something quite pleasurable (Martinson 1990, 1995). Sooner or later, most children learn the pleasures of stimulating their genitals. Once that connection is made, the threat of punishment and sin may not be enough to keep a child from masturbating. Generally, American adults are very uncomfortable with masturbation by infants and children. There are exceptions, of course, as for instance, the practice of indigenous Hawaiian adult caregivers masturbating or fellating infants to calm them at night.

Most children seem to forget their early masturbation experiences. Two thirds of the males in Kinsey's study reported hearing about masturbation from other boys in their prepubescent or early adolescent years before they tried it themselves. Fewer than one in three males reported they rediscovered masturbation entirely on their own. Two out of three females in Kinsey's sample learned about masturbation by accident, sometimes not until after they were married. Some women reported they had masturbated for some time before they realized what they were doing.

In the 1940s, Kinsey and his associates reported that close to 90% of males and about 50% of females masturbated by the midteens. Studies in the 1980s show an increase in these numbers, with a fair estimate that today nearly three quarters of girls masturbate by adolescence and another 10% or so wait until their 20s. About 80% of adolescent girls and 90% of adolescent boys masturbate with frequencies ranging from once a week to about daily (Hass & Hass 1993, 151, 285).

### C. Adults

Race and ethnicity, religion, educational level, and sexual education appear to be important variables that affect the incidence of masturbation. African-Americans engage in masturbation less often than whites and are more negative about it. Very little is known about Latino masturbation attitudes and practices. We are not aware of any studies on masturbation among other major groups, such as Asians and Native Americans. Religion is a key variable, especially given the continuing condemnation of masturbation by the Roman Catholic Church. Granted many Catholics engage in masturbation, but on a continuum, they are more likely to experience guilt feelings than Protestants or Jews. Likewise, persons from fundamentalist-Protestant backgrounds are more likely to have negative attitudes toward masturbation than liberal Protestants. Kinsey and many subsequent researchers have found that, as education level increases, especially among women, the acceptance and approval of masturbation as a sexual outlet increases. Finally, experience with sex education is an important variable (Heiby & Becker 1980). Persons who have had sex education appear to hold more-tolerant attitudes.

Data indicate that about 72% of young husbands masturbate an average of about twice a month. About 68% of young wives do so, with an average frequency of slightly less than once a month (Hunt 1974, 86). According to data reported by Edward Brecher in *Love, Sex and Aging* (1984), women in their 50s, 60s, and 70s reported a consistent masturbation frequency of 0.6 to 0.7 times a week. In their 50s, men reported masturbating 1.2 times a week, with a decline to 0.8 times a week in their 60s, and 0.7 times a week over age 70.

The incidence of masturbation has continued to increase in recent years among both college and postcollege women. During the 1980s, between 46% and 69% of college women

in several surveys reported masturbating. In the 1990s, other surveys have found 45% to 78%. Postcollege women also became more accepting of masturbation as they received psychological permission, instruction, and support in learning about their own bodies. In fact, in self-reports of masturbation, a majority of postcollege-age, college-educated women indicated this was a sexual outlet. In a large-scale sample of college-educated women, without regard to marital status, frequency of masturbation was 7.1 times per month. By contrast, high-school-educated, married women engaged in masturbation only 3.7 times per month (Davidson & Darling 1993).

Not all women feel comfortable with masturbation. Among college women, 30% reported "shame" as a major reason for not engaging in this outlet. Other research indicates that only about half of college women believe that masturbation is a "healthy practice." Even with the apparent increasing incidence of masturbation, considerable data exist that suggest negative feelings toward the practice still deter many college women from choosing this source of sexual fulfillment. And, of those who do engage in masturbation, they do so much less frequently than men, 3.3 times a month for college women compared with 4.8 times for college men (Davidson & Darling 1993).

In general, women are more likely than men to report guilt feelings about their masturbation. Further, substantial evidence suggests that such guilt feelings may interfere with the physiological and/or psychological sexual satisfaction derived from masturbation. In fact, the presence of masturbatory guilt has various implications for female sexuality. Such guilt feelings have been found to inhibit the use of the diaphragm, which necessitates touching the genitals for insertion (Byrne & Fisher 1983). Presumably, this would also affect use of other vaginally inserted contraceptives. Women with high levels of masturbatory guilt experience more emotional trauma after contracting an STD, and exhibit greater fear about telling their sex partner about being infected, than women with low masturbatory guilt. Masturbatory guilt may also inhibit women from experiencing high levels of arousal during foreplay as a prelude to having vaginal intercourse.

One indication of changing attitudes of women toward self-loving is the publication of *Sex for One: The Joy of Selfloving*, by Betty Dodson (1988), and her subsequent appearance on television talk shows. At the same time, the swift dismissal of the U.S. Surgeon General for daring to suggest that masturbation might be mentioned as part of safer-sex education for children indicates that a prevailing negative societal attitude toward masturbation continues.

### [D. Research Update

WALTER BOCKTING

[Update 2003: New findings of studies on masturbation in the U.S. are consistent with recent European studies (Dekker & Schmidt 2002; Kontula & Haavio-Mannila 2002) in challenging the belief that masturbation is a substitute for sex with a partner. According to Kinsey's "hydraulic" theory of sexuality (Laumann et al. 1994, 133), each individual has a given sex drive that can be measured by his or her total sexual outlet; when sex with a partner is less frequent, masturbation becomes the alternative sexual outlet to reach orgasm. However, results from the U.S. *National Health and Social Life Survey* (Laumann et al. 1994) and two recent studies among U.S. college students (Pinkerton, Bogart, Cecil, & Abramson 2002; Zamboni & Crawford 2002) found no such relationship between partner sex and masturbation. Rather, findings indicated that people who have regular sex partners, live with their sex partners, or are married, are more likely to masturbate than people without sexual partners or who live alone (Michael, Gagnon, Laumann, & Kolata 1994).

[A number of demographic factors have been shown to influence the prevalence and frequency of masturbation. Men are more likely to masturbate than women (63% versus 37% reported masturbating in the last year) and to masturbate more frequently (Laumann et al. 1994; Pinkerton et al. 2002). In terms of age, younger (18-24) and older (50-59) men and women are less likely to masturbate. Rather than being a function of biological age in and of itself, this may be because of the prevailing social attitudes and norms during adolescence when masturbation habits are formed (Kontula & Haavio-Mannila 2002; Pinkerton et al. 2002). The more-conservative attitudes toward masturbation and sexuality in the United States might also explain why the increase in young women's masturbation found in Europe (Dekker & Schmidt 2002) has not yet been observed in America. In terms of education, the higher educated are more likely to masturbate and do so more frequently. Finally, black men and women are less likely to report masturbating than white men and women, however, those black women who did report masturbating were doing so more frequently than white women (Laumann et al. 1994).

[The most common reasons for masturbation reported by Americans are: 1. to relieve sexual tension (73% for men and 63% for women); 2. physical pleasure (40% for men and 42% for women); 3. partner unavailable (32% for both genders); 4. to relax (26% of men and 32% of women); 5. to go to sleep (16% for men and 12% for women); 6. partner doesn't want sex (16% for men and 6% for women); 7. boredom (11% of men and 5% of women); and 8. fear of AIDS/STD (7% for men and 5% for women). Fifty-four percent of men and 47% of women felt guilty after masturbation (Laumann et al. 1994).

[The taboo associated with masturbation (Bullough 2002) and the stigma associated with the study of masturbation (Coleman 2002) has left this safer-sex practice virtually unexplored in HIV-prevention research. To fill this gap, Robinson and colleagues (2002) examined the relationship between masturbation and HIV risk among low-income African-American women. The majority (62%) had experience with masturbation, over a third (36%) reported recent masturbation, and a few (13%) reported more than occasional feelings of guilt. Women who masturbated were more likely to report having multiple sexual partners, being in a nonmonogamous relationship, and engaging in high-risk sexual behavior. Thus, while masturbation is very safe sex, the women who reported masturbating were more (not less) likely to be at risk for HIV infection or transmission. Consistent with these findings, a study among U.S. college students found that women who masturbate more often had a greater number of lifetime sexual partners, and women who started masturbating at an earlier age were at higher risk for HIV (Pinkerton et al. 2002).

[Together, these findings indicate that masturbation is indeed not a substitute for those who are sexually deprived, but an activity that stimulates and is stimulated by other sexual behavior (Michael et al. 2002, 165). Sexual attitudes and social norms seem to influence the practice and experience of masturbation. Although many of the misconceptions about masturbation have faded because of an increased understanding of human sexuality (Bullough 2002), much about the role of masturbation in sexual development and sexual health remains to be discovered. (*End of update by W. Bockting*)

[*Current Cultural Observations* MARTHA CORNOG

[*Comment 2003*: Cultural involvement with masturbation has expanded considerably in the United States over the last few decades. Use of sex toys and sex aids has be-

come more common and a subject for research (Blank & Whidden 2000; Davis, Blank, Lin, & Bonillas 1996; Elliott & Brantley 1997, 28-29; Maines 1998). While public discourse has evoked many of the old taboos—we recall the chastisement of Paul “Pee-Wee Herman” Reubens, charged with masturbating in a dark theater, and Dr. Joycelyn Elders, dismissed as Surgeon General for suggesting schools mention masturbation as part of sex education—the topic has become a reliable vehicle for humor in film, television, and stand-up comedy (Cornog 2003, 285-291).

[Certainly, the market for sexually arousing materials (“pornography”) has expanded in print, video, and now on the Net (Lane 2000). Since many people use these materials during masturbation, we know one thing, at least: There's a whole lot of masturbating going on. Elliott and Brantley (1997, 28) reported that 67% of the male college students in their sample used a “pornographic magazine” to masturbate, and 13% of female students did so.

[Group masturbation, which has probably flourished underground for centuries and is mentioned in connection with boys' “circle jerks” as early as the 1700s, has become somewhat accepted as an adult activity with the growth of semipublic “jacks” clubs in the U.S. and also internationally (Cornog 2002). On a lesser scale, far more people probably share masturbation with each other than ever before, especially through telephone sex and cybersex.

[A long-neglected area has been publishing. Only a dozen books about masturbation appeared in the U.S. from 1960 to 1990. But 18 have come out since 1990, five in the last three years. American culture seems to be evolving towards seeing masturbation as a fascinating subject, as real sex with its own unique pleasures, and as an activity to share with someone you love as well as enjoy alone. (*End of comment by M. Cornog*)

## 5. Interpersonal Heterosexual Behaviors

### A. Childhood Sexuality

DAVID L. WEIS\*

Within American culture, childhood sexuality remains an area that has been largely unexplored by researchers. Childhood is widely seen as a period of asexual innocence. Strong taboos continue concerning childhood eroticism, and childhood sexual expression and learning are still divisive social issues. This general ambience of anxiety associated with the sexuality of children is probably understandable, given the general history of sexuality in the U.S.A., with its focus on adult dyadic sex within committed intimate relationships and its opposition to other sexual expressions. This ambience remains, despite the fact that nearly a century has passed since Freud introduced his theory of psychosexual stages with an emphasis placed on the sexual character of childhood development. This reluctance to accept childhood sexuality is somewhat ironic, because Freudian theory, with its concepts of psychosexual stages (oral, anal, phallic, and latency), penis envy, the Oedipus/Electra complexes, repression, and the unconscious, has been immensely popular in the United States throughout much of the 20th century. Yet, the general American public has been able to ignore the prominence given to childhood sexual development by Freudian theorists and to maintain its central belief that childhood is and ought to be devoid of sexuality.

Perhaps no area reviewed in this section has been the subject of less scientific research than this topic of childhood sexuality. To some extent, the paucity of research has been because of general social concerns about the ethical implications of studying children or assumptions about the

\*With input from Paul Okami.

possible harm to children that would result if they were to be included in sexuality research. Researchers have frequently had difficulty gaining the permission of legal guardians to ask children questions about their knowledge of sexuality. In this atmosphere, it would be exceedingly difficult to get permission to ask children about their sexual behavior. One consequence of this general social concern has been that most of the relevant research has been confined to asking adults or college students to report retrospectively about events that occurred in their childhood. There are rather clear and obvious limitations to this approach.

On the other hand, we should recognize that many American scientists themselves have been unwilling to study the sexuality of children. A recent review, *Sexuality Research in the United States: An Assessment of the Social and Behavioral Sciences* (di Mauro 1995), is notable for the fact that it never mentions childhood sexuality. It might be interesting to determine the extent to which American researchers accept the premise that scientific explorations of sexuality might be harmful to children. For example, the field of child development, a sizable branch of American psychology, has largely ignored the issue of sexuality in their work (Maccoby & Martin 1983; Mussen 1983). An examination of standard developmental texts or reviews of the child-development research literature is striking for its omission of sexuality. Significant bodies of child-development research in such important areas as language acquisition, cognition, communication, social behavior, parent-child interaction, attachment (Allgeier & Allgeier 1988), parenting styles, and child compliance have emerged with scant attention to the possible sexual elements of these areas, or to the ways in which these areas might be related to sexual development (Mussen 1983). As just one example, Piaget never investigated the issue of children's sexual cognition, and there has been little subsequent research exploring the application of his theoretical model to sexual development. Similarly, the emergence of family systems theory has also largely ignored the sexuality of children—except to explain the occurrence of incest.

At the same time, it is just as true that sexuality researchers have largely ignored the work of child developmentalists and other scientific disciplines in their own work. They have speculated about how theories of psychoanalysis, social learning, cognition, attribution, social exchange, and symbolic interactionism might be applied to the sexuality of children or to the process of sexual development, but they have rarely tested such assertions empirically (see Allgeier & Allgeier 1988 and Martinson 1976 for examples). Moreover, sex researchers have largely failed to examine how the various processes studied by developmentalists relate to sexuality.

A third domain of this fractured American approach to child development is the fairly recent emergence of professional fields devoted solely to the issue of child sexual abuse. We present a review of child sexual abuse itself later in this chapter (see second subsection in Section 8A, Significant Unconventional Sexual Behaviors, Coercive Sex). Here, we wish to make the point that professional groups—e.g., social workers and family therapists devoted to the treatment of victims of child sexual abuse—have emerged, largely since the 1970s, with a corresponding body of work devoted to that concern. After having been largely neglected for much of the 20th century, the treatment of child sexual abuse has become a sizable “industry” in recent years. Unfortunately, much of the work that has been done within this perspective has failed to consider existing data on normative childhood sexuality (Okami 1992, 1995). For example, it is frequently asserted that child sexual abuse has the negative consequence of “sexualizing” the child's world. We do not mean to claim that

child sexual abuse is either harmless or nonexistent. However, the notion that a “sexualized” childhood is a tragic outcome of sexual abuse rests on the American premise that childhood should be devoid of sexuality. It assumes that childhood should not be sexual. From this perspective, the concept of child sexual abuse has been extended to include family nudity—a point certain to shock naturalists in many countries around the world—parents bathing with their children, “excessive” displays of physical affection (such as kissing and hugging), and even children of the same age engaging in sex play (Okami 1992, 1995). Thus, we seem to have come full circle. Many professionals have come to accept the premise that childhood ought to be an innocent period, free of sexuality. The fact that this view ignores much of the existing data seems to have had little impact on either the American public or many professionals working with children.

### *Childhood Sexual Development and Expression*

In reviewing the process of child sexual development and the phenomenon of child eroticism, it is crucial to consider the meanings that children attach to their experience. There is a tendency to interpret childhood experiences in terms of the meanings that adults have learned to attach to similar events. This ignores the reality that young children almost certainly do not assign the same meanings to “sexual” events as adults. They have yet to conceptualize a system of experiences, attitudes, and motives that adults label as “sexual” (Allgeier & Allgeier 1988; Gagnon & Simon 1973; Martinson 1976). A good example is provided by the case of childhood “masturbation.” Young children often discover that “playing” with their genitals is a pleasurable experience. However, this may well not be the same as “masturbating.” Masturbation, as adults understand that term, is a set of behaviors defined as “sexual” because they are recognized as producing “sexual arousal” and typically having orgasm or “sexual climax” as a goal. Young children have yet to construct this complex set of meanings. They know little more than that the experience is pleasurable; it feels good. In fact, it would be useful to see research that examines the process by which children eventually learn to label such self-pleasuring as a specifically sexual behavior called masturbation.

From this perspective, sexual development is, to a considerable extent, a process characterized by the gradual construction of a system of sexual meanings. Gagnon and Simon (1973) have provided a theoretical model of sexual scripting that examines how these meanings are assembled in a series of stages through social interaction with various socialization agents. In their discussion of the model, Gagnon and Simon stressed their intention that it would serve as an organizing framework for future research on the process of sexual development. Although we believe that the model does provide a potentially fruitful framework for thinking about the process of sexual development, and despite the fact that more than 20 years have passed since its original presentation, there is nearly as great a need for research of this type today as when they formulated the model.

One component of the model proposed by Gagnon and Simon (1973) was the concept of assemblies, by which they meant to convey their view that sexual development is actively constructed by humans rather than merely being an organic process. Among the major assemblies they identified were:

1. the emergence of a specific gender identity,
2. the learning of a sense of modesty,
3. the acquisition of a sexual vocabulary,
4. the internalization of mass-media messages about sexuality,
5. the learning of specific acts defined as sexual,

6. the learning of gender, family, and sexual roles,
7. the learning of the mechanisms and process of sexual arousal,
8. the development of sexual fantasies and imagery,
9. the development of a sexual value system,
10. the emergence of a sexual orientation, and
11. the adoption of an adult sexual lifestyle.

Gagnon and Simon maintained that these assemblies were constructed through interactions with a variety of socialization agents, such as parents and family members, same-sex peers, cross-sex peers, and the mass media. To this list, we would suggest adding the church, the school, the neighborhood/community, and boyfriends/girlfriends as potentially important socialization agents. For Gagnon and Simon, the task for researchers was to examine and identify the associations between the activities of various socialization agents and the corresponding construction of specific sexual assemblies. Although a fair amount of research has been conducted on such associations among adolescents (see the following section), sadly there remains relatively little research along these lines for younger children. As such, we will not present a detailed discussion of the activities of each socialization agent here.

Lacking space to review each of the assemblies, we have had to be selective and have chosen to focus on the more explicitly erotic dimensions. However, we do wish to note that each is ultimately important to a full understanding of sexual development, and it is likely that each of these assemblies is related to the others. Although we do not have space to review the research on the development of gender roles and gender identity, it appears that most American children have formed a stable gender identity by the age of 2 or 3 (Maccoby & Martin 1983; Money & Ehrhardt 1972). It also seems likely that, as children acquire sexual information and experience, they filter what they learn in terms of what is appropriate for males and females. Since norms for male and female behavior, both sexual and nonsexual, tend to differ, this filtering process seems likely to lead to differences in the content of and processes of male and female sexual development.

On the other hand, we would caution the reader to resist the temptation to conclude that gender differences in sexuality are invariably large, or that they apply to all dimensions of sexuality. Recent reviews of existing research indicate that many aspects of sexuality are not characterized by male-female differences and that many differences are small in magnitude (Oliver & Hyde 1993). Ultimately, the issue is a matter for empirical investigation. Unfortunately, there has been relatively little empirical research attempting to link gender-role development (of which there has been a great deal of research in the last 30 years) with the processes of more overtly sexual development.

*Childhood Sexual Eroticism and Expression.* Martinson (1976) has drawn a distinction between what he calls reflexive and eroticized sexual experiences. Reflexive experience is pleasurable and may be a result of learning contingencies, but eroticized experience is characterized by self-conscious awareness and labeling of behavior as sexual. As a general guideline, younger and less-experienced children would seem more likely to react to sexual stimuli in a reflexive manner; older and more-experienced children are more likely to have learned erotic meanings and to define similar behaviors as "sexual." However, there has been virtually no research detailing the process in which this transition occurs or identifying the factors associated with it.

*Sexual Capacity and Autoerotic Play.* It has been clear for several decades that infants are capable of reflexive sexual re-

sponses from birth. Male infants are capable of erections, and female infants are capable of vaginal lubrication (Allgeier & Allgeier 1988; Halverson 1940). Lewis (1965) observed pelvic thrusting movements in infants as early as 8 months of age. Generally, these events appear to be reactions to spontaneous stimuli, such as touching or brushing of the genitals. However, the Kinsey research group (1953) did report several cases of infants less than 1 year of age who had been observed purposely stimulating their own genitals. In their cross-cultural survey, Ford and Beach (1951) reported that, in cultures with a permissive norm, both boys and girls progress from absent-minded fingering of their genitals in the first year of life to systematic masturbation by the age of 6 to 8.

With few exceptions, most research on childhood sexual experiences has asked adolescents or adults to describe events in their past. Males participating in such studies commonly report memories of what they call "their first pleasurable erection" at such ages as 6 and 9 (Martinson 1976), although, as we have just seen, studies of infants themselves document the occurrence of erections from birth. Kinsey and his associates (1953) did report that almost all boys could have orgasms without ejaculation three to five years before puberty, and more than one half could reach orgasm by age 3 or 4. Comparable data for females have not been presented. In addition, both boys and girls between the ages of 6 and 10 have reported becoming sexually aroused by thinking about sexual events (Langfeldt 1979).

Much has been made in the U.S.A. of the fact that sexual arousal in boys is readily visible (erections). A number of authors have argued that this increases the probability that young boys will "discover" their penis and are, thus, more likely to stimulate their own genitals than are girls. This idea has become part of the folklore of American culture. We know of no evidence that substantiates this idea. In fact, Galenson and Roiphe (1980) report that there are no gender differences in autoerotic play during the first year of life.

American culture does not encourage such childhood sex play and actively seeks to restrict it. In a study in the 1950s, only 2% of mothers reported that they were "permissive" about their own children's sex play (Sears, Maccoby, & Levin 1957). It is also interesting to note that the researchers in this study did not provide a response category that allowed mothers to indicate they "supported" or "encouraged" sex play. Martinson (1973) found this pattern extended well into the 1970s. In a later investigation of parental views toward masturbation, Gagnon (1985) found that the majority (86%) of this sample believed that their preadolescent children had masturbated. However, only 60% of the parents thought that this was acceptable, and only one third wanted their children to have a positive attitude about masturbation.

*Sex Play with Other Children.* The capacity to interact with another person in an eroticized manner and to experience sexual feelings, either homosexual or heterosexual, is clearly present by the age of 5 to 6. Langfeldt (1979) did observe both mounting and presenting behaviors in boys and girls at 2 years of age. He also observed that prepubertal boys who engaged in sex play with other children typically displayed penile erections during sex play. Ford and Beach (1951) found that children in cultures, unlike the U.S.A., who are able to observe adult sexual relations will engage in copulatory behaviors as early as 6 or 7 years of age. Moreover, in some cultures, adults actively instruct children in the techniques or practice of sexual relations (Ford & Beach 1951; Reiss 1986). This cross-cultural evidence appears to have had little impact on the way in which most Americans, including many sexuality professionals, think about childhood sociosexual interactions.

Again, most of the research in the U.S.A. has been based on recall data from adolescents or adults. Our impressions of childhood sexual interactions are biased toward periods that such older respondents can remember. A number of studies have examined the frequency of childhood sexual behaviors (Broderick 1965, 1966; Broderick & Fowler 1961; Goldman & Goldman 1982; Kinsey et al. 1948, 1953; Martinson 1973, 1976; Ramsey 1943). Taken together, these studies demonstrate that many American children develop and maintain an erotic interest in the other or same sex, and begin experiencing a wide range of sexual behaviors as early as age 5 to 6. It is not uncommon for Americans to report that they remember "playing doctor" or similar games that provide opportunities for observing and touching the genitals of other children, undressing other children, or displaying their own genitals to others. Many American children also acquire experience with kissing and deep kissing (what Americans call French kissing). In fact, generations of American children have played institutionalized kissing games, such as "spin the bottle" and "post office." These studies also provide evidence that at least some American children experience sexual fondling, oral sex, anal sex, and intercourse prior to puberty. Many of these behaviors are experienced in either heterosexual or homosexual combinations or both.

We have purposely avoided reporting the specific frequencies of the childhood sociosexual experiences in these studies because each possesses severe limitations with respect to generalizability. Most have had small samples drawn from a narrow segment of the total population in a specific geographic region. As early as the 1960s, researchers found evidence of racial and community differences in the rate of such behaviors (Broderick 1965, 1966; Broderick & Fowler 1961). In addition, most have used volunteer samples with respondents who were trying to recall events that had occurred ten or more years earlier. Moreover, these studies were conducted over a period of five decades, during which there would seem to be great potential for changes. Comparisons among these studies are virtually impossible. As a result, we would have little confidence in the specific accuracy of frequency estimates.

A review of a few of these studies illustrates this point. Interviewing a group of boys in a midwestern city in the early 1940s, Ramsey (1943) found that 85% had masturbated prior to age 13, one third had engaged in homosexual play, two thirds had engaged in heterosexual play, and one third had attempted or completed intercourse. The Kinsey group (1948), using a broader sample of adults, reported that 45% had masturbated by age 13, 30% had engaged in homosexual play, 40% had engaged in heterosexual play, and 20% had attempted intercourse. For girls, the Kinsey group (1953) reported that roughly 20% had masturbated prior to age 13, roughly one third had engaged in both heterosexual and homosexual play, and 17% had attempted intercourse. They also reported an actual decline in sexual behaviors after age 10 (Kinsey et al. 1948). The large differences between the Ramsey and Kinsey findings could be because of sample size, differences in geographic region or size of the city, differences in the time period of data collection, or differences in the age range of the samples. Here, it is interesting to note that the Kinsey group (1948) also interviewed a small sample of boys. Roughly 70% reported some form of child sex play, a figure that is much closer to Ramsey's findings. In the larger Kinsey sample, only 57% of adult males and 48% of adult females reported memories of childhood sex play, usually between the ages of 8 to 13 (Kinsey et al. 1948, 1953). It would seem possible, then, that studies with adult samples recalling their childhood experiences might yield lower estimates than studies of children themselves.

John Money (1976) and Money and Ehrhardt (1972) argue that childhood sex play with other children is a necessary and valuable form of rehearsal and preparation for later adult sexual behavior. He has also suggested that such sex play may occur as part of a developmental stage in childhood. Certainly, this phenomenon has been observed in other primate species, such as the chimpanzee (DeWaal 1982). However, Kilpatrick (1986, 1987) found no differences in various ages of adult sexual functioning between persons who had childhood sexual experiences with other children and those who did not. Given the complexity of the model of sexual assemblies we have presented here, it is not surprising that the effects are not that simple.

*Sibling Incest.* We discuss incest and child sexual abuse more fully in Section 8A, Significant Unconventional Sexual Behaviors, on coercive sex. Here, we merely wish to note that, in one of the few studies of sibling incest with a nonclinical sample, Finkelhor (1980) found that 15% of female and 10% of male college students reported having a sexual experience with a brother or sister. Approximately 40% of these students had been under the age of 8 at the time of the sexual activity, and roughly 50% had been between the ages of 8 and 12. Three quarters of the experiences had been heterosexual. Some type of force had been used in one quarter of the experiences. The most common sexual activities were touching and fondling of the genitals. Only 12% of the students had ever told anyone about these sexual activities with a brother or a sister. Interestingly, most of the students reported that they did not have either strong positive or negative feelings about these experiences. Positive reactions were reported by 30%, and another 30% reported negative reactions. Positive reactions were associated with consensual activities (no force had been used) and an age difference of four or fewer years. For males, there were no correlations between prior sibling experiences and current sexual activity. Among females, those who had had sibling sexual experiences were more likely to be currently sexually active. Those women who had positive sibling experiences after age 9 had significantly higher sexual self-esteem, whereas those who had sexual experiences before age 9 with a sibling more than four years older had lower self-esteem.

*Sexual Contacts with Adults.* A recent national survey (Laumann et al. 1994) found that 12% of men and 17% of women reported they had been sexually touched by an older person while they were children. The offender was typically not a stranger, but a family friend or a relative, a finding that is comparable to more-limited samples. We present a more complete review of sexual contacts with adults later in Section 8A, Significant Unconventional Sexual Behaviors, Coercive Sex, on child sexual abuse and incest. Relatively few studies of adult-child sexual contacts have been conducted with nonclinical samples. In general, they indicate that children experience a wide range of reactions, from highly negative or traumatic to highly positive, to such contacts in both the short term and long term (Kilpatrick 1986, 1987; Nelson 1986; Farrell 1990). Moreover, there do not appear to be any simple or direct correlations between such childhood experiences and later measures of adult sexual functioning. In her study of incest, Nelson (1986) found no correlation between affective outcomes and type of erotic activity, sexual orientation, or consanguinity. Kilpatrick (1986) did find that the use of force or abuse was significantly related to impaired adult sexual functioning in several areas.

*Same-Sex Childhood Experiences.* Our discussion to this point has not focused exclusively on heterosexual experience, but it is certainly fair to say that investigations of

heterosexual child sex play have dominated existing research. One study of 4- to 14-year-old children found that more than one half of boys and one third of girls reported at least one homosexual experience (Elias & Gebhard 1969). Masturbation, touching of the genitals, and exhibition were the most common activities, although there were also some reports of oral and anal contacts. The fact that children have had such a homosexual experience does not appear to be related to adult sexual orientation (Bell, Weinberg, & Hammersmith 1981; Van Wyk & Geist 1984).

Storms (1981) has hypothesized that such experiences may be related to adult sexual orientation as a function of sexual maturation. He suggests that persons who become sexually mature during the period of homosocial networks (discussed below) may be more likely to romanticize and eroticize these childhood homosexual experiences and, thus, develop a later preference for sexual partners of the same gender. In effect, when sexual maturation, goal-directed masturbation, homosexual explorations, and eroticized fantasies are paired before heterosexual socialization occurs (typically at about age 13), they are more likely to lead to a homosexual orientation later. As far as we know, Storms's ideas have never been directly tested through research.

*Childhood Social Networks.* During middle childhood (roughly ages 6 to 12), both boys and girls in the U.S.A. tend to form networks of same-sex friends. A pattern of gender segregation, where boys and girls have separate friends and play groups, is central to the daily life of middle childhood. This pattern of homosocial networks is readily observable at elementary schools across the U.S.A. Girls and boys tend to cluster at school into separated, same-sex groups. At lunchtime, they frequently sit at separate "girls' tables" and "boys' tables." On the playground, space and activities tend to be gendered. After school, children tend to associate and play in gender-segregated groupings. In fact, this pattern of gender separation may be more pronounced in middle childhood in the U.S.A. than the more-publicized racial segregation.

It should be acknowledged that these homosocial networks are not characterized by a total separation of the genders. There are some opportunities for heterosocial interactions and play, and children do vary with respect to the extent in which they associate with the other sex. As just one obvious example, some girls, who are known as "tomboys," spend considerable time associating with boys. Still, to a large extent, the worlds of boys and girls in middle childhood in the U.S.A. are separated.

Maltz and Borker (1983) have suggested that these homosocial networks can be viewed as distinct male and female cultures. As cultures, each has its own set of patterns, norms, and rules of discourse. Boys tend to play in groups that are arranged in a hierarchy. They stress a norm of achievement ("doing") and emphasize competitive, physical activities. Conflict is overt and is often resolved directly through physical fighting. Differentiation between boys is made directly in terms of power and status within the group. Since boys belong to more than one such group, and because group memberships do change over time, each boy has an opportunity to occupy a range of positions within these hierarchies. Boys' groups also tend to be inclusive. New members are easily accommodated, even if they must begin their membership in a lower-status position. Courage and testing limits are prime values of boys' groups, and breaking rules is a valued form of bonding. In examining how these patterns influence male communication, Maltz and Borker (1983) report that males are more likely to interrupt others, they are more likely to ignore the previous statement made by another speaker, they are more likely to

resist an interruption, and they are more likely to directly challenge statements by others.

Girls tend to associate in smaller groups or friendship pairs. Girls, for example, tend to be highly invested in establishing and maintaining a "best friend" relationship. They stress a norm of cooperation ("sharing") and pursue activities that emphasize "working together" and "being nice." They frequently play games that involve "taking turns." Friendship is seen as requiring intimacy, equality, mutual commitment, and cooperation. However, girls' groups also tend to be exclusive. Membership is carefully reserved for those who have demonstrated they are good friends. Conflict tends to be covert, and it is highly disruptive, leading to a pattern of shifting alliances among associates. Differentiation between girls is not made in terms of power, but rather in relative closeness. Girls are more likely to affirm the value of rules, especially if they are seen as serving group cohesion or making things fair. Girls may break rules, but their gender group does not provide the intense encouragement and support for this behavior seen among boys. Maltz and Borker (1983) note that girls are more likely to ask questions to facilitate conversation, they are more likely to take turns talking, they are more likely to encourage others to speak, and they are more likely to feel quietly victimized when they have been interrupted.

These largely segregated gender networks in middle childhood serve as the contexts for learning about adolescent and adult sexual patterns, as well as for other areas of social life. There is, of course, a certain irony to the fact that homosocial networks serve as a principal learning context for heterosexuality in a culture with such strong taboos against homosexuality as the U.S.A. In fact, Martinson (1973) has argued that these gender networks and this period serve as the settings for a fair amount of homosexual exploration and activity. In one sense, it is almost certainly true that some homosexual activity results from these patterns of social organization. However, this assertion is largely undocumented, and we are not aware of any studies that compare the level of homosexual activity in cultures with homosocial networks with cultures having some other form of childhood networks.

Thorne and Luria (1986) have used this concept of gendered cultures to examine the process of sexual learning in middle childhood. They found that "talking dirty" is a common format for the rule-breaking that characterizes boys' groups. They noted that talking dirty serves to define boys as apart from adults, and that boys get visibly excited while engaging in such talk. Boys also often share pornography with each other and take great care to avoid detection and confiscation by adults. These processes provide knowledge about what is sexually arousing, and they also create a hidden, forbidden, and arousing world shared with other boys, apart from adults and girls. Miller and Simon (1981) have argued that the importance attached to rule violations creates a sense of excitement and fervor about sexual activity and accomplishment.

One other feature of boys' groups is that they serve as a setting for learning both homoeroticism and homophobia. Boys learn to engage in what Thorne and Luria call "fag talk." That is, they learn to insult other boys by calling them names, like "faggot" and "queer." Eventually, they learn that homosexuality is disapproved by the male peer group. Boys at age 5 to 6 can be observed touching each other frequently. By age 11 to 12, touching is less frequent and reduced to ritual gestures like poking each other. On the other hand, much of the time spent with other boys is spent talking about sex. This serves to maintain a high level of arousal within the group. Moreover, the sanctioning of rule-break-

ing leads to some homosexual experimentation that is kept hidden from the group. Homosexual experiences may become one more form of breaking the rules and one more feature of the secret, forbidden world of sexuality.

In contrast, girls are more likely to focus on their own and their friends' physical appearance. They monitor one another's emotions. They share secrets and become mutually vulnerable through self-disclosure. They have giggling sessions with their friends, with sex often being the source of amusement. Their talks with other girls tend to focus less on physical activities and more on relationships and romance. They also plot together how to get particular boys and girls together in a relationship.

These sexual patterns are largely consistent with the norms of the respective gender cultures. Males tend to focus on physical activities; females on cooperation and sharing. They are also quite consistent with patterns that will become firmly established in adolescent sociosexual patterns. Thus, male and female peer groups become the launching pads for heterosexual coupling as boys and girls begin to "go together." Finally, they serve to heighten the romantic/erotic component of interactions with the other gender.

[*Puberty and Menarche* ROBERT T. FRANCOEUR

[*Update 1998*: A puzzling phenomenon has been noted in new data regarding the onset of female puberty in the United States (see Table 10). According to a 1997 study of 17,000 girls ages 3 through 12 seen in 65 pediatric practices around the country, American girls are reaching puberty earlier than previously believed. Nearly half of African-American and 15% of white girls are beginning to develop sexually by age 8 (Herman-Giddens 1997). The average age of menstruation for white girls has been unchanged for 45 years. For black girls—about 9.6% of the 17,000 girls in the study—the average age of menarche is about four months younger than it was 30 years ago, when poor nutrition and poverty, which can delay puberty, afflicted more blacks.

[Preliminary comparisons of these data with puberty onset and menarche data from a variety of other countries indicate that the age of menarche is roughly similar around the world, while the onset of puberty is about two years earlier in the United States than it is in other countries.

[The study raises questions about whether environmental estrogens, chemicals that mimic the female hormone estrogen, are inducing earlier puberty among some girls. Environmental estrogens occur from the breakdown of chemicals in products ranging from pesticides to plastic wrap. Natural estrogen is used in some hair products, including pomades marketed to blacks. Research is needed to ascertain whether and to what extent natural and environmental estrogen may be affecting sexual development.

[As the study's lead author, Marcia Herman-Giddens of the University of North Carolina at Chapel Hill, noted, the new data also suggest that sex education should begin sooner than is current practice. "I don't think parents, teachers, or society in general have been really thinking of chil-

dren that young having to deal with puberty." (*End of update by R. T. Francoeur*)]

### *Professional and Social Issues of Childhood Sexuality*

As we stated at the beginning of this section and as should be apparent from the review of sex education in the U.S.A., there are a number of issues concerning childhood sexuality that have been controversial for decades. Moreover, several new issues have become points of social conflict in recent years. We can only briefly mention four here.

*The Oedipus and Electra Complexes.* The Goldmans' (1982) multinational study of children and sexual learning, including a sizable American sample, raises questions about these complexes. Freud's thesis about castration anxiety and its resolution (typically by the age of 5) would presumably require some awareness of genital differences between males and females, unless one wishes to interpret Freud's terminology strictly as metaphorical. In the Goldman study, the majority of English-speaking children did not understand these differences until they were 7 to 9 years old. Interestingly, a majority of the Swedish children could accurately describe these differences by the age of 5.

*Is There a Latency Period?* The notion of a latency period, roughly from ages 6 to 11, has had great appeal in American culture. This may be because of the impression that the homosocial networks of middle childhood reflect a lack of sexual interest, and to the fact that many Americans prefer to believe that childhood is a period of sexual innocence. Freud (1938) originally proposed in 1905 that middle childhood is characterized by relative sexual disinterest and inactivity, something like a dormant period. Freud also maintained that latency was more pronounced among boys than girls. The review above should certainly dispel the notion that childhood, at any point, is essentially characterized by sexual disinterest.

In addition, Broderick (1965, 1966) not only provided evidence of active sex play during middle childhood, but also demonstrated that most children indicate they wish to marry as an adult, and that most of these children are actively involved in a process of increasing heterosocial interaction and love involvements during childhood. A majority said they had had a boyfriend or girlfriend and had been in love, and 32% had dated by age 13. If anything, we would expect that the age norms for many of these behaviors have actually decreased since that time. Interestingly, those children who indicated that they did not wish to marry eventually were substantially less likely to report any of these activities.

*Parental Nudity.* Experts have disagreed over the years as to the impact of parental nudity on children (Okami 1995). Some have argued that childhood exposure to parental/adult nudity is potentially traumatic—largely because of the large size of adult organs. Others have insisted that strong taboos on family nudity may lead to a view that the body is unacceptable or shameful. This group has argued that a relaxed attitude toward nudity can help children develop positive feelings about sexuality. Similar concerns have been expressed about the primal scene and sleeping in the parental bed. In a survey of 500 psychiatrists, 48% indicated that they believe that children who witness their parents engaging in intercourse do suffer psychological effects (Pankhurst 1979). American experts appear to overlook the fact that most families throughout the world sleep in one-room dwellings. In one study of these issues, Lewis and Janda (1988) asked 200 college students to report their

**Table 10**

#### **The Onset of Puberty in American Girls**

	Breast and Pubic Hair Development			Average Age of Menarche
	By Age 8	By Age 7	By Age 3	
African-American girls	48.3%	27.2%	3%	12.16 years
White girls	14.7%	6.7%	1%	12.88 years

childhood experiences. Exposure to parental nudity for ages zero to 5 and 6 to 11 was generally unrelated to a series of measures of adult sexual adjustment. Sleeping in the parental bed yielded several small, but significant correlations. Persons who had slept in their parents' bed as children had higher self-esteem, greater comfort about sexuality, reduced sexual guilt and anxiety, greater frequency of sex, greater comfort with affection, and a higher acceptance of casual sex as college students.

Okami (1995) reviewed the literature in these same three areas. His review provides a thorough summary of clinical opinions in each area, as well as an assessment of the empirical evidence. Despite the growing number of clinical professionals who label such acts as sexual abuse, there is virtually no empirical evidence of harm. In fact, the only variable found to be associated with harm is cosleeping, which has been found to be associated with sleep disturbances. However, Okami notes that these sleep disturbances may well have preceded and precipitated the cosleeping, rather than vice versa.

*Female Genital Cutting.* In December 1996, the Centers for Disease Control and Prevention (CDC) estimated that more than 150,000 women and girls of African origin or ancestry in the United States were at risk in 1995 of being subjected to genital cutting or had already been cut. This estimate was based on 1990 Census Bureau data gathered before the recent increase in refugees and immigrants from the 28 countries that span Africa's midsection where female genital cutting varies widely in prevalence and severity (Dugger 1996ab). A second source cites a different estimate from the CDC using data on how much circumcision is practiced in immigrants' homelands and, making assumptions about sex and age, that about 270,00 African females in the United States were circumcised in their home country or are at risk here (Hamm 1996).

In 1996, Congress adopted a dual strategy to combat the practice here. In April 1996, Congress passed a bill requiring the Immigration and Naturalization Service to inform new arrivals of U.S. laws against genital cutting. It also mandated the Department of Health and Human Services to educate immigrants about the harm of genital cutting and to educate medical professionals about treating circumcised women. A law, which went into effect March 29, 1997, also criminalizes the practice, making it punishable by up to five years in prison and a fine of up to \$250,000 for individuals and \$500,000 for organizations such as hospitals. Enforcement of the law, however, is problematic for several reasons. First, no one is sure how the law will apply to those immigrants who take their daughters out of the country for the rite. Second, doctors who spot cases of genital mutilation are reluctant to report it for fear of breaking up tight-knit families. Also, when the wounds are healed, it is impossible to ascertain whether the rite was performed here or before arrival in the United States. Finally, there is the secretiveness surrounding this rite of passage, which many African cultures consider essential, and also the hidden nature of the wounds and scars. Sierra Leoneans, for instance, who consider genital cutting part of an elaborate, highly secret initiation rite, view questions about it as a profound invasion of their privacy (Dugger 1996ab).

A government prevention program focuses on educating both old and recent immigrants in how to survive and assimilate in American society while maintaining their own culture and religion. To this purpose, the U.S. Department of Health and Human Services has organized meetings with advocates for refugees and nonprofit groups that work closely with Africans to develop strategies for combating

this practice. Muslim religious leaders, for instance, are invited to explain that the Koran does not require this practice. However, lack of a specific budget hampers this effort.

In one attempt to ameliorate this clash of cultural values, doctors at Harborview Medical Center in Seattle, Washington, persuaded Somali mothers to be satisfied with nicking the clitoral hood without removing any tissue. The ritual usually involves removing the clitoris and sewing the labia closed. The compromise was abandoned in December of 1996 when the hospital was inundated with hundreds of complaints, led by a group of feminists, protesting even this compromise, even though the nicking of the clitoral hood has no short- or long-term negative consequences. The massive objection to this compromise raises serious questions of ethnocentrism on the part of the Americans who protested it. It seems somewhat ironic that such complaints would be made in a culture where we routinely circumcise penises. Although some maintained that the compromise of nicking may violate the letter of the law, it remains to be seen what kind of solution will be achieved in this matter (Dugger 1996b).

*Child Pornography.* It is widely believed, and the Federal Bureau of Investigation (FBI) perpetuates the notion, that child pornography is pervasive and increasing. Several state and federal laws have been enacted in the last 20 years to combat this perceived social problem. The mere possession of a photograph of a naked child has been criminalized in some states. Yet, it is virtually impossible to find any commercial child pornography in the U.S.A. In fact, most of the materials seized by the FBI are private photographs of naked children—with no adults appearing in the photos and no sexual behaviors depicted (Klein 1994; Stanley 1989). Efforts to raid child-pornography businesses have routinely failed to seize any child pornography. FBI sting operations may well have arisen from the corresponding frustrations of government agencies to find any child pornography. One recent legend now circulating is the claim that the U.S. government is now the largest producer of child pornography in the world. This claim is unsubstantiated as far as we know, but, again, it reflects the anxiety of American culture over the sexuality of its children.

[*Childhood Sexuality, 1997 to 2003* DAVID L. WEIS

[*Update 2003:* Since the publication of the original edition of the *International Encyclopedia* in 1997 and the single volume, *Sexuality in America: Understanding Our Sexual Values and Behaviors*, in 1998, the focus of writings about childhood sexuality has continued to be placed on child sexual abuse (CSA). Much of this research still continues with the assumption that early sexual experience in childhood will almost certainly be harmful (Loeb et al. 2002). Yet, meta-analyses of child sexual abuse using college samples have shown only small effects, if any. Survivors of child sexual abuse have been found to have slightly lower scores on various measures of personality adjustment. However, these findings were not significant when family environment was also assessed. Finally, males have reported different kinds of child sexual abuse experiences than females (Leonard & Follette 2002; Loeb et al. 2002; Rind, Bauserman, & Tromovitch 1998).

[One of the few voices crying in the wind against the onslaught of abstinence-only education and the characterization of childhood sex as pathological or as high-risk behavior is Judith Levine (2002). She calls this the "politics of fear." Levine actually argues that children should be taught that most expressions of sexuality are normal and healthy. She cautions that the recent trend is potentially harmful and may lead to greater anxiety about sex and greater life-long

social problems. She maintains that we need to teach our children how to experience sexual pleasure in a safe way.

[At the same time, other researchers (Alexander 2003) are beginning to explore such areas as the possible link between sex differences in the brain and male-female toy preferences, gender recognition in infancy, and other behaviors. (End of update by D. L. Weis)]

## B. Adolescent Sexuality

DAVID L. WEIS

### *Courtship, Dating, and Premarital Sex*

In stark contrast to the relative inattention given to childhood sexuality in the U.S.A., Americans have been fascinated by the sexual behavior of adolescents throughout the 20th century. One is tempted to describe the interest as an obsession. Perhaps no area of sexuality has received as much scrutiny, by both the general public and professionals, as the sexual practices of American teenagers. There have been literally hundreds of scientific studies attempting to determine the rate of adolescent premarital coitus, as well as other aspects of adolescent sexuality. The easy availability of populations to study is only one of the more-obvious reasons for this extensive research.

Since more than 90% of Americans ultimately do marry, investigations of adolescent sexual development and premarital sexual practices largely overlap. General trends have been well documented, compared to other areas of sexuality. Given the vast scope of this research, we can review only the highlights here. (For more extensive reviews of research on adolescent and premarital sexuality, see Cannon & Long 1971; Clayton & Bokemeier 1980; and Miller & Moore 1990.)

The issue of premarital sexuality and virginity has been a focus of considerable social conflict and concern throughout the 20th century, and remains so to this day. Beginning in the early years of that century, a large literature documents the continuing concern of American adults about the increasing number of teenagers who have experienced sexual intercourse prior to marriage. Interestingly, each successive birth cohort of American adults in that century has been concerned about the tendency of their offspring to exceed their own rate of premarital coitus.

Much of the professional literature has reflected these same concerns. Through much of the 20th century, the tone of most professional writings has been moralistic. Adults in the U.S.A., including most sexuality researchers, have tended to view adolescent premarital sexual intercourse, premarital sex, as a deviant behavior, as a violation of existing social norms, and as a growing social problem (Spanier 1975). Research has tended to parallel this perspective by emphasizing the costs or negative consequences of adolescent sexuality, such as sexually transmitted disease (venereal disease), "illegitimate" pregnancy, and loss of reputation (Reiss 1960). This tone may have shifted to a less-judgmental, more-analytic perspective in the 1960s and 1970s (Clayton & Bokemeier 1980). However, with the emergence of AIDS and the rise of out-of-wedlock pregnancies in the early 1980s, the general tone has reverted in recent years, with studies of "risk-taking" behavior, "at-risk" youth, and portrayals of adolescent sexuality as a form of delinquency (Miller & Moore 1990).

### *Trends in Adolescent Sexuality*

Despite these adult concerns, it would be fair to suggest that premarital virginity has largely disappeared in the U.S.A., both as a reality and as a social ideal. As we enter the 21st century, the overwhelming majority of Americans now have sexual intercourse prior to marriage, and they begin at younger ages than in the past. "Love" has largely re-

placed marital status as the most valued criteria for evaluating sexual experience (Reiss 1960, 1967, 1980). Virtually all Americans believe that intimate relationships (like marriage) should be based on love, that love justifies sexual activity, and that sex with love is a more-fulfilling human experience. This view has not only been used to justify premarital sexual activity between loving partners, but has also become a criterion for evaluating marital sexuality itself and justifying a pattern of divorce and remarriage.

*Premarital Sexual Behavior.* These trends may not be quite as dramatic as most Americans imagine. A study of marriages in Groton, Massachusetts, from 1761 to 1775 found that one third of the women were pregnant at the time of their weddings (cited in Reiss 1980), demonstrating that premarital sex was already fairly common in the colonial period (see discussion of bundling in Section 1A, Basic Sexological Premises). Several early sexuality surveys also document that premarital sex occurred among some groups prior to the 20th century. Terman (1938) compared groups who were born in different cohorts around the beginning of the 20th century. Of those born before 1890, 50% of the men and only 13% of the women had premarital coitus. Two thirds of the men who had premarital sex did so with someone other than their future spouse, whereas two thirds of the women who had premarital sex did so only with their future spouse. For those born after 1900, two thirds of the men and nearly half of the women had premarital sex. The relative percentage having premarital sex with their fiancés also increased. Fully half of the men and 47% of the women had sexual relations with their fiancé(e)s prior to marriage.

The Kinsey team (1953) found that one quarter of the women born before 1900 reported they had premarital sex, whereas one half of those born after 1900 said they had premarital sex. Like the Terman study, the major change was an increase in the percentage of women born after 1900 who had premarital sex with their fiancés. The Kinsey study also indicated that the period of most-rapid change was from 1918 to 1930—the "Roaring Twenties." Burgess and Wallin (1953) reported similar findings for a birth cohort born between 1910 and 1919. These studies indicated that roughly two thirds of the men born after 1900 had premarital sex. The Kinsey studies also found that there had been comparable increases in female masturbation and petting behavior as well.

It is important to note that the growth of premarital sex in the first half of the 20th century occurred primarily within the context of ongoing, intimate relationships. It appears that the percentage of males and females having premarital sex remained fairly stable through the 1950s and early 1960s. In a study of college students during the 1950s, Ehrmann (1959) found rates similar to the Kinsey figures cited above. Ehrmann found that males tended to have greater sexual experience with females from a social class lower than their own, but they tended to marry women from their own social class. Males who were "going steady" were the least likely to be having intercourse. In contrast, females who were "going steady" were the most likely to be having intercourse. In a study comparing college students in Scandinavia, Indiana, and Utah (predominantly Mormon), Christensen (1962) and Christensen and Carpenter (1962) found that rates of premarital sex vary by the norms of the culture and that guilt is most likely to occur when premarital sex is discrepant with those norms.

A second wave of increases in premarital sex seems to have occurred in the period from 1965 to 1980. A number of studies of college students through this period indicated increasing percentages of males and females having premarital coitus (Bauman & Wilson 1974; Bell & Chaskes 1968;

Christensen & Gregg 1970; Robinson, King, & Balswick 1972; Simon, Berger, & Gagnon 1972; Vener & Stewart 1974). For example, Bauman and Wilson (1974) found that, for men, the rate having premarital sex increased from 56% in 1968 to 73% in 1972. For women, the increase was from 46% to 73%. There was no significant change in the number of sexual partners for either gender. Several of these studies indicate that the increases were still moderate by 1970 (Bell & Chaskes 1968; Simon et al. 1972). In an unusual study of male college students attending an eastern university in the 1940s, 1960s, and 1970s, Finger (1975) found that 45% had premarital sex in 1943-44, 62% in 1967-68, and 75% in 1969-73.

Subsequent studies have indicated that this pattern of increasing premarital sex characterized American youth in general. In a study of urban samples in the mid-1970s, Udry, Bauman, and Morris (1975) found that 45% of white teenage women had intercourse by age 20, and 80% of black women did. Roughly 10% of whites had premarital sex by age 15 and 20% of blacks did. Zelnik and Kantner found similar percentages in their studies in 1971 and 1976 (Udry, Bauman, & Morris 1975; Zelnik, Kantner, & Ford 1981).

Reports of increasing sexual activity among adolescents have not been limited to coitus. A number of researchers have reported similar increases in the rate of heavy petting (manual caressing of the genitals) through the late 1960s and 1970s (Clayton & Bokemeier 1980; Vener & Stewart 1974). There have also been reports of increasing levels of oral sex among adolescents (Haas 1979; Newcomer & Udry 1985). In some studies, teenage girls have been more likely to have participated in oral sex than intercourse, and between 16% to 25% of teens who have never had intercourse have had oral sex (Newcomer & Udry 1985). Weis (1983) has noted that this group may be involved in a transition from virginity to nonvirginity, at least among whites.

Perhaps the single best indicator of the trends occurring from 1965 to 1980 is the series of studies by Zelnik and Kantner in 1971, 1976, and 1979 (Zelnik et al. 1981). These studies, known as the *National Surveys of Young Women*, investigated the sexual histories of 15- to 19-year-old women. The 1971 and 1976 studies were full national probability studies while the 1979 study focused on women living in metropolitan areas. The Zelnik and Kantner research shows a dramatic rise in sexual activity for both black and white women from 1971 to 1976. The pattern of increases continued for white women through 1979, but premarital sex rates for black women remained stable from 1976 to 1979. Among metropolitan women, premarital sex rose from 30.4% in 1971 to 49.8% in 1979. For blacks, the rate moved from 53.7% in 1971 to 66.3% in 1976, and was 66.2% in 1979. The 1979 study also showed that 70% of males had premarital sexual intercourse; the figure for black men was 75% (Zelnik & Shah 1983; Zelnik et al. 1983).

In a review of these trends, Hofferth, Kahn, and Baldwin (1987) noted that females in the 1980s became sexually active at younger ages and that fewer teenagers married. As a result, the rate of premarital sex increased. The proportion of women at risk of premarital pregnancy increased dramatically from 1965 to the 1980s. The out-of-wedlock pregnancy rate among teenagers increased for both blacks and whites from 1971 to 1976. This trend continued for whites through 1982, but remained level for blacks after 1976. Finally, they noted that, for women born between 1938 and 1940, 33.3% had premarital sex by age 20. For women born between 1953 and 1955, the figure was 65.5%.

Despite recent claims in some quarters of a return to chastity and abstinence in the late 1980s and 1990s (McCleary 1992), there is no evidence of a decline in premarital sexual

behavior. National data from 1988 indicate that one quarter of females have premarital sexual intercourse by age 15; 60% do so by age 19. About one third of United States males have premarital sexual intercourse by age 15, and 86% by age 19 (Miller & Moore 1990). In fact, a random telephone survey of 100 students attending a midwestern state university in 1994 found that 92% had had sexual intercourse; only 8% said they were still virgins. Nearly two thirds (63%) said that they had participated in what the survey described as a "one-night stand." With respect to their most recent sexual intercourse, 42% reported using something to "protect" themselves. Of these, 84% reported using condoms; 16% said they used the pill (Turco 1994). If anything, the trends that have been well established throughout the 20th century appear to be continuing. Given the continuation of patterns that have been frequently cited as leading to increasing rates of premarital sex, such as industrialization, rapid transportation, dating, and "going steady," we would not expect a reversal in what is now a century-long trend.

### [Premarital Sex Before Age 15

ROBERT T. FRANCOEUR

[Update 2003: In the 1990s, about 20% of adolescents had had sexual intercourse before their 15th birthday—and one in seven of the sexually experienced 14-year-old girls had been pregnant, according to an analysis by the National Campaign to Prevent Teen Pregnancy (NCPTP). Based on seven studies conducted in the late 1990s—three federally financed surveys of young people by the *National Survey of Family Growth*, the *National Longitudinal Survey of Adolescent Health*, and the *National Longitudinal Survey of Youth*—and four smaller data sets, the NCPTP analysis provides a comprehensive look at the sexual activities of 12- to 14-year-olds, a group often overlooked in discussions of adolescent sexuality.

[A variety of more-recent surveys indicate that teens are increasingly delaying their sexual initiation. Recent federal data, for instance, indicate that the birthrate for girls 14 and younger declined 43% from 1991 to 2001, while the decline for older teenagers was 27%. And according to an Alan Guttmacher Institute report, the pregnancy rate for 12- to 14-year-olds dropped 40% from 1990 to 1999.

[On the danger side, only about a third of parents of sexually experienced 14-year-olds knew that their child was having sex. While most parents said they had spoken to their young adolescent children about sex, far fewer teenagers remembered having any such conversations with their parents.

[The analysis found that young teens had plenty of opportunity to engage in sex:

- About half of the 14-year-olds had attended a party with no adult supervision;
- about a quarter of the 12- to 14-year-olds had dated or had a romantic relationship with someone at least two years older—the greater the age difference, the more likely the relationship would include sexual intercourse;
- in one study, 4 in 10 of the sexually active young people had had sex in the 18 months preceding the survey; and
- half of the sexually active had engaged in intercourse more than twice in the last year.

[Adding to the risk of pregnancy and sexually transmitted diseases are other high-risk behaviors engaged in by young nonvirgins (see Table 11).

[The fact that half to three-quarters of the experienced 12- to 14-year-olds said they had used contraception the first time they had sex indicates their first intercourse was not unexpected (Lewin 2003) (*End of update by R. T. Francoeur*)]

*Premarital Sexual Attitudes (Permissiveness).* There has also been a substantial number of studies examining the attitudes of Americans toward premarital sex, although systematic research in this area began later than research on premarital sexual behavior. Reiss (1960) used the term “permissiveness” to describe the extent to which the attitudes of an individual or a social group approved premarital sex in various circumstances. In general, research has found that premarital sex attitudes have become progressively more permissive throughout the 20th century, roughly parallel to the increases in premarital sexual behavior (Bell & Chaskes 1970; Cannon & Long 1971; Christensen & Gregg 1970; Clayton & Bokemeier 1980; Glenn & Weaver 1979; Vener & Stewart 1974). Reiss (1967) developed what has come to be called Autonomy Theory to explain this process. According to Reiss, premarital sexual permissiveness will increase in cultures where the adolescent system of courtship becomes autonomous with respect to adult institutions of social control, such as the church, parents, and the school. This appears to have happened in the U.S.A. and most other industrialized nations in the 20th century.

By far, the biggest change has been the growth of a standard that Reiss (1960, 1967, 1980) called “permissiveness with affection,” in which premarital sex is seen as acceptable for couples who have mutually affectionate relationships. This standard has grown in popularity in the U.S.A. as the double standard—the view that premarital sex is acceptable for males but not for females—has declined (Clayton & Bokemeier 1980; Reiss 1967, 1980). By 1980, a majority of adults as well as young people in the U.S.A. believed that premarital sex is appropriate for couples involved together in a serious relationship (Glenn & Weaver 1979). Moreover, although there has been a historical tendency for males to be more permissive about premarital sex than females, these gender differences have been diminishing in recent decades (Clayton & Bokemeier 1980).

#### *Circumstances of Adolescent Sexual Experiences*

Most research on adolescent sexuality has tended to focus on whether or not teenagers or college students have had premarital sexual intercourse. Although this allows us to provide reasonable estimates of the percentages of Americans who have had premarital sex in various time periods and to track trends in the rate of virginity and nonvirginity, this same focus has frequently led researchers to ignore the circumstances in which adolescent sexuality occurs (Miller & Moore 1990). As a consequence, we cannot be as confident about the trends in several related areas, and many questions about the specific nature of adolescent sexual experiences and relationships remain to be explored.

*First Intercourse.* A good example of this lack of perspective is provided by the evidence concerning age at first intercourse. The available research indicates that the average age of first intercourse has been declining since 1970. It seems likely that this trend extends back prior to 1970, but the paucity of relevant data from earlier time periods makes such a conclusion highly tentative. As late as that year, only

about one quarter of the males and 7% of the females who attended college had intercourse prior to age 18 (Simon et al. 1972). In the Zelnik and Kantner studies, the average age for females dropped from 16.5 in 1971 to 16.2 in 1976 (Zelnik et al. 1981). By 1979, the average age of first intercourse for women was 16.2; for males, it was 15.7. Blacks of both genders tended to experience sexarche at slightly younger ages than whites. Females had first partners who were nearly three years older, whereas males had first partners who were about one year older than they (Zelnik & Shah 1983).

In a study of college females in the 1980s, Weis (1983) found the average age of sexarche to be 16.2. A later study of college students found that the average age was 16.5 (Sprecher, Barbee, & Schwartz 1995). It should be noted, however, that persons who attend college may well be more likely to postpone sexual activity. It is conceivable that a trend of declining age at first intercourse is still occurring among populations that do not attend college, and it is possible that teenagers in the 1990s (who have yet to reach the age of college) may also be having intercourse at younger ages.

Intercourse appears to be, at least among whites, the culmination of a sequence of increasing and expanding experiences with kissing, petting, and possibly oral sex (Spanier 1975; Weis 1983). There is some evidence that women who have rehearsed these noncoital activities extensively, and thus gradually learned the processes of sexual interaction, are more likely to report positive reactions to their first intercourse (Weis 1983). Weis (1983) found that there is great variation as to when people go through these stages and how quickly.

Most authors have stressed the negative aspects of first intercourse for females by citing the finding that females are significantly more likely to report negative affective reactions to their first intercourse than males (Koch 1988; Sprecher et al. 1995). However, the available data strongly suggest that the differences between males and females may not be large in magnitude. It is clear that females report a wide range of affect, from strongly positive to strongly negative (Koch 1988; Schwartz 1993; Weis 1983), but it is also clear that many males report experiencing negative reactions as well. In a study of college students, the males were more likely to report experiencing high levels of anxiety, the females were less likely to report experiencing high levels of subjective pleasure, while sizable numbers of both genders reported experiencing guilt (Sprecher et al. 1995). Positive reactions to first intercourse have been found to be related to prior experience with noncoital sexual activities, having an orgasm in that first intercourse encounter, descriptions of the partner as gentle and caring (for females), involvement with the first partner for more than one month prior to first intercourse, continued involvement with the partner following the first intercourse, and situational factors, such as the consumption of alcohol (Schwartz 1993; Sprecher et al. 1995; Weis 1983). Several researchers have reported that age is associated with affective reactions, but Weis (1983) found that age was not as strongly or directly related as the level of prior noncoital experience. Schwartz (1993) also reported that Scandinavian teenagers were more likely to report positive reactions than a group of American adolescents.

Over the past three decades, a convergence of male and female premarital sex behavior has been identified, with females reporting less emotional attachment to their first coital partners than in the past (Hopkins 1977; Kallen & Stephenson 1982; Koch 1988). Yet, there is still a significant difference between the genders, with males reporting

**Table 11**

#### **Risky Behaviors Associated with Early Sexual Experience**

<b>Risk Behavior</b>	<b>Virgins</b>	<b>Nonvirgins</b>
Drinking regularly	3%	18%
Smoking regularly	8	29
Have used marijuana	10	43

more casual relationships and females more intimate relationships with their first partners (Koch 1988).

In the only national study of first intercourse, Zelnik and Shah (1983) found that more than 60% of the females were "going with" or engaged to their first partner. Another third described their first partner as a friend. Roughly a third of the males described their first partner as a friend, and 40% were "going with" or engaged to their first partner. The males were twice as likely to have their first intercourse with someone they had just met, although few males or females did this (Zelnik & Shah 1983).

Relationship factors have been reported to be associated with affective reactions to the first intercourse. However, the precise nature of this association remains unclear. There is some evidence that involvement with a partner for longer than one month, and continuing involvement following the first intercourse, are associated with positive affective reactions (Sprecher et al. 1995). There is some evidence that females who are "going with" or engaged to their first partner are more likely to experience positive affect (Weis 1983). However, Weis (1983) also found that attributions that the first partner was caring, considerate, and gentle were more strongly related to affective reactions. Moreover, many women who were "going with" or engaged to their first partner, nonetheless, described their partners as uncaring and inconsiderate. It should be noted that each of these studies found so few participants who were married at the time of their first intercourse that no analyses could be done for that relationship category. For example, not one woman in the Weis (1983) study was married at the time of her first intercourse.

Adolescents appear to have many reasons for becoming involved in premarital sexual behavior. Motivations most frequently mentioned by a group of college women for becoming involved in their first intercourse experience included (rank-ordered by declining frequency): love-caring, partner pressure, curiosity, both wanted to, alcohol or other drugs, and sexual arousal (Koch 1988). The comparable rank-ordering of motivations by a group of college men included: both wanted to, curiosity, love-caring, sexual arousal, to "get laid," and alcohol/drug use. Women were four times more likely to report partner pressure than men, whereas men were seven times as likely to say they were looking to "get laid" and twice as likely to report sexual arousal as a motivation for sexarche (Koch 1988).

Most American teenagers describe their first intercourse as an "unplanned, spontaneous" event. Only 17% of the females and one quarter of the males in a national study said they had planned their first intercourse (Zelnik & Shah 1983). In the same study, less than one half of the males and females used a contraceptive. Those who had their first intercourse at age 18 or older were more likely to use a contraceptive. White women were more likely to have used some form of contraception, but black women were more likely to use a medically prescribed method. Women who described their first intercourse as planned were more likely to have used a contraceptive—fully three quarters of these women did. However, more than two thirds of these women relied on their partners to use a condom or withdrawal. Black women were more likely to use a contraceptive themselves, rather than rely on their partner.

Finally, various aspects of sexarche have been found to be significantly related to later sexual functioning among college students (Koch 1988). Women who had experienced first coitus at an earlier age had less difficulty reaching orgasm during later sexual interactions than did women who had sexarche at a later age. Men with earlier sexarche had less difficulty in keeping an erection during later sexual in-

teractions than men who had been older at sexarche. Also, women who had reported negative reactions to their first intercourse were subsequently more likely than those who felt more positively to experience: lack of sexual interest, sexual repulsion, inability to reach orgasm, or genital discomfort, pain, or vaginal spasms. Men who reacted negatively to their first intercourse were more likely to ejaculate too quickly during later sexual experiences than men who had positive reactions. Both men and women were more likely to experience subsequent sexual functioning concerns when they were pressured by a close partner to engage in intercourse for the first time.

*Number of Premarital Sexual Partners.* It is difficult to provide good estimates on the number of premarital sex partners prior to 1950, simply because researchers failed to ask such a question. On the other hand, it does seem clear that the increase in the percentage of American women who reported they had ever had premarital sex after 1900 was primarily because of an increase in the percentage of women who reported they had premarital sex only with their fiancé (Kinsey et al. 1953; Terman 1938). In contrast, there is abundant evidence of a significant increase in the number of premarital sex coital partners for females from the late 1960s through the late 1980s (Cannon & Long 1971; Clayton & Bokemeier 1980; Miller & Moore 1990; Vener & Stewart 1974; Zelnik et al. 1983). This finding is, however, potentially misleading. A close inspection of the results of pertinent studies reveals that most of the increase is explained by a shift from zero to one partner and from one to two partners. There were no increases in the percentage with seven or more partners.

Among males, there is some evidence that adolescent boys of recent decades are less likely to use the services of a prostitute than in the past (Cannon & Long 1971). In a unique study of males attending the same eastern university from the 1940s through the 1970s, Finger (1975) actually reported a decline in the number of premarital sex partners with a corresponding increase in the frequency of sexual relations. This was primarily because of an increase in the percentage of men who had premarital sex only with their girlfriends. Finger also reported a decline in the percentage of males reporting they ever had a homosexual experience. However, among those who had a homosexual experience, the frequency of such encounters had increased.

Although there appears to be consistent evidence that there have been significant increases in the number of premarital sex partners throughout the 20th century, at least for females, it should be stressed that, as late as 1990, the majority of American teens had had zero or one premarital sex partner. Only 4% of white females, 6% of black females, 11% of white males, and 23% of black males reported six or more partners (Miller & Moore 1990). Thus, the widely held idea that large percentages of American adolescents are now "promiscuous" is greatly exaggerated.

*Rates of Teen Pregnancy and Birth.* In an examination of how the trends we have been reviewing are related to trends in adolescent pregnancy and birth, it is important to bear in mind that, as late as 1965, several states in the U.S.A. prohibited the sale of contraceptives to *married* couples. Such laws banning the sale of contraceptives to teenagers and/or single persons were common until 1977 (see Section 9A on contraception). Details on out-of-wedlock births, contraception, and abortion are presented later. Here, we want to note that the birthrate among unmarried women has been increasing since 1965, with a notable surge in the rate during the 1980s (Baldwin 1980; Forrest & Fordyce 1988; Miller & Moore 1990). Throughout this period, the percentage of unmarried, adolescent women exposed to the risk of pregnancy

has been increasing. One principal reason for this is, of course, the increasing percentage of unmarried persons having premarital sex in the U.S. (Forrest & Fordyce 1988). (See also Section 9B, Contraception, Abortion, and Population Planning, Childbirth and Single Women.)

However, there are several interesting twists among these trends, many of which do not fit with the conventional wisdom in the U.S.A. First, much of the increase since 1980 is attributable to women 20 years of age or older. In fact, the adolescent birthrate has actually been declining since the early 1970s (Baldwin 1980; Forrest & Fordyce 1988). Second, the overall birthrate for adolescent women increased through the late 1940s and 1950s, remained stable in the 1960s, increased in the early 1970s, and has been declining since (Baldwin 1980). The misperception, widespread through the U.S.A., that teen-pregnancy rates have been rising is largely because of two factors: 1. the increasing number of such pregnancies, but not the rate, when the children of the baby-boomer generation began having children, and 2. the fact that, as the average age at first marriage has been increasing, adolescent pregnancies are more likely to occur with unmarried women (Baldwin 1980; Miller & Moore 1990). Finally, the perception that adolescent pregnancy has become a recent social problem has emerged as the out-of-wedlock birthrate has increased more dramatically among white women in the last two decades (Baldwin 1980; Miller & Moore 1990).

*Contraceptive Use.* To most Americans, an increase in the rate of adolescent pregnancy (widely assumed, though not true) would seem to be an inevitable result of increases in premarital sexual activity. However, research in many European countries demonstrates that high rates of adolescent sexual activity can be associated with low rates of adolescent pregnancy, when contraceptives are used widely, consistently, and effectively (Jones et al. 1985). There seems little doubt that the U.S.A. has one of the highest adolescent-pregnancy rates among developed nations, largely because of inconsistent contraceptive use (Forrest & Fordyce 1988; Miller & Moore 1990).

It appears that roughly one half of adolescent women use no contraceptive during their first intercourse (Miller & Moore 1990), and most of the women reporting the use of some contraceptive during their first intercourse note that their partner used a condom (Weis 1983). Moreover, most adolescent girls who seek contraceptive services have been having sexual intercourse for some time, many for more than a year before they seek services (Miller & Moore 1990; Settlege, Baroff, & Cooper 1973). After this delay, it appears that roughly two thirds of American teenagers now use some form of contraceptive (Miller & Moore 1990).

Although these figures certainly indicate that large numbers of American youths continue to experience sexual intercourse with no contraceptive protection, they nonetheless represent an increase in contraceptive use over the last several decades. Research in the early 1970s indicated that two thirds to three quarters of American teens rarely or never used contraceptives (Sorensen 1973; Zelnik et al. 1981). Forrest and Fordyce (1988) report that overall use of medically sound contraceptives remained stable through the 1980s. Of those women age 20 or less who sought family-planning services in 1980, nearly three quarters used the pill. By 1990, this had dropped to 52%. In 1980, 14% had used no contraceptive at all (Eckard 1982).

By 1990, Peterson (1995) reported that 31.5% of 15- to 19-year-old women consistently used some form of contraceptive; 24.3% of 15- to 17-year-olds did so, as did 41.2% of 18- and 19-year-olds. This behavior appears to be unrelated to social class (Settlege et al. 1973). Among women of

childbearing age (15 to 44), Peterson (1995) found that 52.2% of Hispanic, 60.5% of white non-Hispanic, and 58.7% of black non-Hispanic women reported using some form of contraceptive (see Table 17 in Section 9A under Current Contraceptive Behavior).

Despite the popularity of the idea that adolescent pregnancy is a result of poor sexual knowledge, knowledge of one's sexuality or birth control has not been shown to be a strong predictor of contraceptive behavior among teenagers (Byrne & Fisher 1983). No relationship was found between contraceptive use and early sex education by family, or a congruence between attitudes and behavior. Reiss, Banwart, and Foreman (1975), however, reported that contraceptive use among teenagers is correlated with endorsement of sexual choice (permissiveness), self-confidence about desirability, and involvement in an intimate relationship.

### *Explanations of Adolescent Sexuality*

Of course, researchers are not content to provide descriptions of social trends. Instead, they seek to provide theoretically useful explanations of the factors underlying those trends. The essence of scientific analysis is the identification and testing of potential correlates of those trends. There have been thousands of studies of adolescent sexuality testing possible correlates. We cannot review them all here. We will, however, briefly identify several different approaches that have been used to explain the trends we have described above. We have tried to select perspectives that have enjoyed some popularity among sexuality professionals at some point. We have also tried to include explanatory models that represent the diversity of professional opinions about adolescent sexuality.

*Changes in Social Institutions.* By far, the most common approach to explaining the growing acceptance of premarital sex within American culture and the increasing tendency of adolescents to have premarital sex has been a sociological perspective that locates these trends as part of a series of social changes occurring in response to industrialization and urbanization. (Much of this explanation was presented in Section 1, Basic Sexological Premises, where we reviewed the sexual history of the U.S.A.) As patterns of residence and community relations changed in the late 19th and early 20th centuries, changes began to occur in most social institutions. These included changes in male-female roles, a lengthening of the period of formal education, and the emergence of new forms of heterosexual courtship (Ehrmann 1964; Reiss 1967, 1976). One example of the complex web of social changes that have occurred in the last century is the increasing average age of first marriage (Surra 1990). In one century, the average age at first marriage has shifted from the late teens to the mid-20s. Combined with the earlier age at which American adolescents reach puberty, this has led to a much longer period between physical maturation and marriage, thus, greatly expanding the probability that sexual activity will occur prior to marriage.

As social institutions changed in response to the growing industrial character of American society and the increasingly urban pattern of residence, new forms of adolescent courtship emerged. The custom of dating appeared in the 1920s following World War I, and the practice of "going steady" emerged in the 1940s following World War II (Reiss 1980). By the 1990s, the practice of "going together" has become so universally common that few American young people can conceive of other courtship forms. Dating provided a forum for adolescents to pursue male-female relationships independent of adult supervision and control. The appearance of modern transportation, such as the automobile, and the development of urban recreational busi-

nesses allowed adolescents to interact with each other away from home. Increasingly, decisions about appropriate sexual behavior were made by adolescents themselves. The practice of "going steady" placed adolescents into a relationship with many of the features of marriage. Steady relationships were defined as monogamous and exclusive with respect to sexuality and intimacy. As such, they carried high potential for intimacy, commitment, and feelings of love. Together, the increased independence and greater potential for intimacy led to increased rates of premarital sexual behavior (D'Emilio & Freedman 1988; Kinsey et al. 1948, 1953; Seidman 1991). There is evidence that this general pattern has occurred in other countries as a consequence of industrialization as well (Jones et al. 1985).

Reiss (1960, 1967) developed the Autonomy Theory of Premarital Permissiveness, mentioned earlier, to explain the association between social institutions and premarital sexual permissiveness. Essentially, Reiss maintained that, as adolescent courtship institutions (dating and going steady) become independent of adult institutions of social control (parental supervision, the schools, and the church), the level of premarital permissiveness in a culture increases. There has been considerable research testing the specific propositions of the theory since Reiss proposed it (Cannon & Long 1971; Clayton & Bokemeier 1980; Miller & Moore 1990). Generally, research from this perspective has tended to presume that premarital sex has become normative within American culture.

*Sources of Sexual Information and Sexual Knowledge.* Several other explanations of premarital sexual behavior have been more likely to view it as a social problem and more likely to focus on the individual character of premarital sex attitudes and behavior. One of the more popular and enduring ideas within American culture about adolescent sexual activity is the belief that sexual behavior and pregnancy risk are influenced by knowledge about sexuality and its consequences. In fact, advocates of sex education in the schools have argued for more than a century that American teens typically possess inadequate and inaccurate sexual knowledge. Some have maintained that sex education could solve such social problems as out-of-wedlock pregnancy and sexually transmitted disease by providing thorough and accurate information about sexuality. Embedded in these assertions is an underlying presumption that sexual decision-making and behavior are primarily cognitive processes. Operating from this perspective, there have been dozens of studies of the sources of sexual information for children and adolescents in the U.S.A. Generally, these studies have found that young people in the U.S.A. are more likely to receive sexual information from their peers or the mass media than from adult sources, such as parents or the school (Spanier 1975; Wilson 1994). These studies have been used to conclude that peers are a poor source of sexual information, and that such inaccurate information leads directly to unwanted pregnancies and disease. We should note here that few studies of sexual information have sought to demonstrate a correlation between source of information and sexual decisions or outcomes. That connection has typically been assumed. (See also Section 3, which deals with formal and informal sources of sexual knowledge and education.)

However, in a national probability study of American college students, Spanier (1975, 1978) found no differences in premarital sexual behavior between those students who had ever had a sex-education course and those who had not—regardless of who taught the course, when it was offered, or what material was included. Moreover, a number of studies have found a weak correlation between sexual

knowledge and sexual behavior or contraceptive use (Byrne & Fisher 1983). More generally, researchers have consistently found a low correlation between knowledge level and a variety of health-related behaviors, such as smoking, drug use, and eating patterns (Kirby 1985).

*Cognitive Development.* A somewhat similar focus on cognitive processes has been the basis for an argument that adolescents typically lack a sufficient level of cognitive development required for effective sexual decisions. A number of authors have argued that adolescence is characterized by a cognitive level that is inconsistent with sound sexual decision-making and contraceptive use (Cobliner 1974; Cvetkovich, Grote, Bjorseth, & Sarkissian 1975). Within this perspective, it has become common to describe adolescents as having an unreal sense of infallibility that leads them to underestimate the actual risks of sexual experience (Miller & Moore 1990).

Although references to the works of Jean Piaget have been common in this realm, actual empirical tests of a correlation between Piaget's stages of cognitive development and sexual decisions remain to be conducted. Moreover, this explanation has failed to incorporate the cross-cultural evidence that adolescents in many other nations establish high rates of sexual frequency, maintain consistent contraceptive use, and experience low rates of adolescent pregnancy (Jones et al. 1985).

*Interaction of Hormonal and Social Determinants.* Udry (1990) has attempted to examine how pubertal development, hormones, and social processes may interact to affect the sexual behavior of adolescents. Hormonal studies seem to indicate that androgenic hormones at puberty directly contribute to explaining sexual motivation and noncoital sexual behaviors in Caucasian male and female adolescents (Udry & Billy 1987; Udry et al. 1985, 1986). Because of the differing social encouragement versus constraints for young white males and females, initiation of coitus seems to be strongly hormone dependent for males, whereas for females it seems to be strongly influenced by a wide variety of social sources with no identifiable hormone predictors. The interaction of hormonal and social determinants is unclear for African-American youth and does not fit the models for white youth that emphasize the importance of sociocultural context on sexual behavior.

*Delinquency Models.* Perhaps the zenith of models which regard adolescent sexuality as a social problem is the emergence of frameworks that explicitly define adolescent sexual behavior as a form of juvenile delinquency (Jessor & Jessor 1977; Miller & Moore 1990). Vener and Stewart (1974) reported that sexual behavior by 15- and 16-year-olds was correlated with the use of cigarettes, alcohol, and illicit drugs, and with less approval for traditional institutions like the police, the school, and religion.

In a subsequent study using this perspective, Jessor and Jessor (1977) conceptualized sexual behavior as a "problem behavior" if it occurred prior to age-appropriate norms. In other words, intercourse was characterized as deviant and delinquent if it occurred prior to the mean age (roughly 17 years of age at the time of the study). Jessor and Jessor found that such early sexual behavior was correlated with other "problem behaviors" such as alcohol use, illicit-drug consumption, and political protest. They concluded that these associations demonstrated that adolescents tend to exhibit multiple forms of delinquency.

By the 1990s, Miller and Moore (1990) reported that a number of studies have found that "early" sexual behavior is associated with a variety of "criminal" behaviors such as

those described above. Some authors have overlooked the fact that these studies have found this association with delinquent behaviors only for early sexual behavior and have tended to characterize all adolescent sexual behavior as delinquent. These studies do suggest the possibility that developmental issues may be relevant to these findings.

*Sexual Affect.* A different approach has been taken by a group of researchers interested in examining the role of affective reactions to sexual stimulation, both as a factor that may influence sexual decisions and behavior and as an outcome of sexual experience. Sorensen (1973) reported that 71% of teenagers agreed with the view that using the birth-control pill indicates that a girl is planning to have sex. This has been offered as evidence that adolescents are unwilling or unable to accept responsibility for contraceptive use, and thus lack cognitive development. However, affective theorists would argue that it is just as likely that sexual guilt, fear, or embarrassment prevent such a decision.

In the early 1960s, Christensen (1962) conceptualized sexual guilt as a variable response to sexual experience. He found that adolescents are more likely to report experiencing guilt in cultures with restrictive premarital sex norms. He called this a value-behavior discrepancy. Schwartz (1973) found that persons with high sex guilt retain less information in a birth-control lecture, especially when aroused by a sexually stimulating condition. In the Schwartz study, females retained more information than males across all conditions.

Donn Byrne and his associates have maintained that individuals can be placed on a continuum ranging from erotophilic, reacting to sexual stimuli with strongly positive emotions, to erotophobic, reacting to sexual stimuli with strongly negative emotions. Erotophobic persons have been shown to be less likely to seek contraceptive information, to have lower levels of contraceptive knowledge, and to be less likely to purchase contraceptives or use those contraceptive methods that require them to touch themselves (Byrne & Fisher 1983; Goldfarb, Gerrard, Gibbons, & Plante 1988). However, they are no less likely to retain information about contraceptives, even though they become more sexually aroused by a lecture (Goldfarb et al. 1988).

There is a need for much future research on the association between adolescent sexuality and affective variables. However, the studies just mentioned suggest that affective variables may prove to be a fruitful way of explaining adolescent sexual behavior and its consequences. This approach seems particularly suited to examining the variety of ways that adolescents behave and the diverse consequences of such behavior.

*Reference Group.* Yet another approach to explaining adolescent sexuality has been the attempt to identify persons or groups who have influenced teenagers. Perhaps the most developed theoretical perspective of this type is known as Reference Group Theory. There is some evidence that, as adolescents progress from age 12 to 16, they shift their primary reference-group identification from their parents to their peers. Peer orientation has been shown to be related to sexual intercourse. Moreover, association with peers who are seen as approving premarital sex is correlated with premarital sexual permissiveness and premarital sexual behavior (Cannon & Long 1971; Clayton & Bokemeier 1980; Floyd & South 1972; Reiss 1967; Teevan 1972). Similarly, Fisher (1986) found that the correlation between the attitudes of teenagers and their parents decreased as adolescence progressed. However, females who cited their mothers as their major source of sexual information were less likely to engage in intercourse and more likely to use contraceptives when they did.

These results should not be interpreted to mean that parents or families do not or cannot exert influence on the sexuality of adolescents. There have been relatively few scientific studies of the influence of differing parental styles and the premarital sexual behavior of children. One study (Miller, McCoy, Olson, & Wallace 1986) found that adolescents were least likely to have premarital sex or to approve of premarital sex when their parents were moderately strict. Teenagers who described their parents as very strict or not at all strict were more likely to have had premarital sex. This correlation also held when parents were asked to describe the rules they set for their children. There is some evidence that the age of a mother's first intercourse is related to the age of her daughter's first intercourse (Miller & Moore 1990). Miller and Moore (1990) also showed that girls from single-parent families tend to have sex at younger ages.

Thus, there appears to be two conflicting sets of empirical findings. One set of studies finds evidence that adolescent sexuality is most strongly related to peer influences, especially as age increases. Another set of studies provides evidence that families and parents can exert influence in various ways. Obviously, important questions remain to be resolved.

*Rehearsal.* A more direct perspective views adolescent sexuality as a developmental process, in which intercourse is seen as the culmination of a sequence of progressively sexual behaviors (Miller & Moore 1990; Simon et al. 1972; Weis 1983). Adolescents appear to move through a series of stages, from kissing to petting of the female's breasts to genital petting to intercourse. There is evidence that, among white adolescents, this pattern is strongly consistent. White adolescents appear to take an average of two years to move through this sequence (Miller & Moore 1990; Weis 1983). In contrast, blacks appear to move through the stages more quickly, and there is greater variability in the actual sequence of behaviors (Miller & Moore 1990). Within this perspective, each subsequent sexual behavior can be viewed as a rehearsal for the next behavior in the sequence.

Not only is there evidence that adolescent sexual experience is acquired in a process that produces an escalating and expanding repertoire of sexual behaviors, but dating and "going steady" appear to serve as the key social contexts in which this process occurs (Clayton & Bokemeier 1980; Reiss 1967; Spanier 1975). The age of onset of dating and the frequency of dating appear to be major factors in the emergence of sexual behavior (Spanier 1975). In fact, adolescent experiences with intimate relationships (dating and "going steady") and the sequencing of sexual behaviors have been shown to be more influential in predicting premarital sexual intercourse than general social background variables, parental conservatism or liberalism, or religiosity (Herold & Goodwin 1981; Spanier 1975).

As dating frequency and noncoital experiences increase, exposure to eroticism, sexual knowledge, and interest in sex are all likely to increase concomitantly. Male behavior appears to be more strongly related to the sequencing of behaviors. In contrast, female behavior seems to be more a result of involvement in affectionate relationships. Increased dating interaction and frequency increase sexual intimacy, since opportunities and desire increase. This process is likely to overshadow the influence of prior religious, parental, or peer influences. Thus, adolescent courtship provides the context for the general process of sexual interaction. As Reiss (1967, 1980) has noted, such adolescent courtship also serves as a rehearsal experience for adult patterns of intimate involvement. It is also possible that such adolescent rehearsal experiences are a more powerful and direct explanation of adolescent sexual behavior (Spanier 1975; Weis 1983).

*Multivariate Causal Models.* An important trend in American research on adolescent sexuality has been the growing recognition that several of the factors reviewed here will eventually need to be included in a sound theory of adolescent sexual development and expression. Reiss (1967) was one of the first to test competing hypotheses in an attempt to identify the strongest predictors of premarital sexual permissiveness. Since then, a number of researchers have used multivariate techniques to examine the relative strength of premarital sex correlates (Byrne & Fisher 1983; Christopher & Cate 1988; DeLamater & MacCorquodale 1979; Herold & Goodwin 1981; Reiss et al. 1975; Udry 1990; Udry, Tolbert, & Morris 1986; Weis 1983).

A few examples should illustrate the potential usefulness of this multivariate approach. Herold and Goodwin (1981) found that the best predictors of the transition from virginity to nonvirginity for females were perceived peer experience with premarital sex, involvement in a steady, "committed" relationship, and religiosity. In contrast, parental education, grade-point average, sex education, and dating frequency failed to enter the multivariate equation.

Udry and his associates (1990; Udry et al. 1986) have investigated the relative influence of hormonal and social variables in explaining adolescent sexual behavior. Several studies demonstrate that androgenic hormones present at puberty directly contribute to the sexual motivation and pre-coital sexual behavior of white males. For white males, the initiation of coitus seems to be strongly related to androgen levels. Female initiation of coitus seems, on the other hand, to be strongly related to a series of social variables, but not to any hormonal predictors. Udry has argued that these results reflect the differing social encouragement versus constraints placed on males and females respectively. Interestingly, the behavior of African-American youth does not appear to fit with these same explanations, so that the exact interaction between social factors and hormonal variables remains unclear.

### *Adolescent Sexual Relationships: The Neglected Research*

Before moving to the issue of adult heterosexuality, we wish to make a few comments about the nature of intimacy in adolescent sexual relationships and the process of relationship formation. Most of the research on adolescent sexuality reviewed here has tended to focus on the specifically and explicitly sexual elements of such experiences and to ignore the broader relational aspects. In one sense, this is understandable, given the fact that Americans have generally viewed adolescent sexuality, especially its premarital forms, as a social problem. Consistent with this perspective, Americans have tended to deny the possibility that any genuine intimacy occurs in sexual experiences involving adolescents. This is unfortunate in at least two respects. First, it tends to ignore the fact that most adolescent sexual encounters in the U.S.A. occur within the context of what the participants define as a meaningful, intimate relationship. It also ignores the reality that sexual expression within loving, intimate relationships (rather than marital status) has become the dominant attitudinal standard for Americans of all ages. Second, the tendency to ignore the relational character of adolescent sexuality means that researchers have tended to overlook the reality that patterns of sexual and intimate interactions are largely learned within the context of adolescent experiences, and these are likely to be extended well into adulthood. Thus, the failure to investigate these larger relational questions probably impairs our ability to fully understand adult intimate relationships as well. This is not meant to denigrate other forms of sexual expression or

to deny that other forms of expression do occur, both in adolescence and later. Rather, it is to suggest that one strong characteristic of American sexuality is the tendency to associate love and sexuality. Any attempt to understand or explain American sexual expression must acknowledge that it generally occurs within the context of ongoing, intimate relationships. This is as true for adolescents as for adults.

The separation of sexuality and relational concerns is well reflected by the emergence of two independent bodies of research within the American academy. On the one hand, there is a well-established field of research on the formation of adolescent intimate relationships, dating and courtship, and mate selection. This tradition extends back to the 1920s and has largely been explored by family sociologists. Social exchange theory has become the dominant perspective in this tradition in recent decades. Surra (1990) provides an excellent review of such research through the 1980s. However, this tradition has largely failed to consider sexuality as an issue in courtship and mate selection, although it ought to be apparent that sexual dynamics and processes are key components of adolescent attraction, dating, courtship, and mate selection. Sexuality carries the potential both for increasing intimacy between teenagers or young adults and for creating intense relationship conflict and, possibly, termination. Yet, Surra's (1990) review is notable precisely for the fact that there is not one single citation of a study including sexuality variables. This is not an indictment of Surra *per se*. Her goal was to review the field of mate selection as it stood at the beginning of the 1990s. Her assessment serves to document that researchers in this area continue to ignore the role of sexuality in adolescent relationship processes after seven decades of empirical research.

This tendency to ignore sexuality within the courtship process is unfortunate, because of the growing evidence that one of the major influences on premarital sexual behavior is the intimate relationship in which most adolescent sexual activity occurs. Being involved in a loving and caring relationship increases the probability of a decision to engage in intercourse (Christopher & Cate 1985) and contributes to sustained activity once it begins (DeLamater & MacCorquodale 1979; Peplau, Rubin, & Hill 1977). In fact, most adolescent sexual experiences in the U.S.A., especially for females, occur within the context of an ongoing intimate relationship. It does appear, however, that as the general rates of premarital sex have increased and as the average age of first intercourse have declined throughout the 20th century, intercourse has tended to occur at earlier stages in a relationship (Bell & Chaskes 1970; Christensen & Carpenter 1962; Christensen & Gregg 1970). With respect to attitudes, Americans are more likely to approve of premarital sex in the context of a relationship. This permissiveness-with-affection-and/or-commitment standard has increasingly become the norm for both adults and young people (Christensen & Carpenter 1962; Christensen & Gregg 1970; Reiss 1960, 1967).

A second body of research examining the formation of sexual relationships has begun to emerge in recent decades. Much of this work has been done by biologists or evolutionary social psychologists and extends a model of mammalian mating first presented by Beach (1976). We discuss it here because it also reflects the separation of the sexual and intimate domains of relationships, and because much of the pertinent human research has been done with samples of college students. Essentially, this body of work forms the foundation for what might be called female selection theory.

The traditional view had always been that males are the aggressors and initiators of sexual involvement. From this perspective, females were seen as sexual "gatekeepers."

Their role supposedly was to regulate male access by accepting or rejecting male advances (Perper 1985; Perper & Weis 1987). Beginning with Beach (1976), a growing number of researchers have provided evidence that this traditional view is highly flawed. Instead, females select desirable partners and initiate sexual interaction by proceptively signaling selected males (Fisher 1992; Givens 1978; Moore 1985; Moore & Butler 1989; Perper 1985; Perper & Weis 1987). Males, in turn, respond to these proceptive signals. Moore (1985; Moore & Butler 1989) has demonstrated that, not only do women use such signaling, but that men are more likely to “approach” women who do. Perper (1985; Perper & Weis 1987) has provided evidence that American women employ a variety of complex strategies to arouse male interest and response. Finally, Jessor (1978) has provided some evidence that males are just as likely to accept direct initiations from women as they are to respond to more-covert strategies, although females tend to believe that men are “turned off” by female sexual assertiveness.

This new line of research raises fundamental questions about the roles of males and females in the formation and maintenance of sexual relationships—for both adolescents and adults. It indicates a need for research that is focused on the dynamics within and the processes of sexual relationships themselves. As just one example, Christopher and Cate (1988) found that, early in a relationship, the level of conflict was positively related to a greater likelihood of intercourse. As the relationship progressed, love and relationship satisfaction eventually became significant predictors of sexual involvement. In the case of adolescence, we need to move beyond “social bookkeeping,” counting the number of American teenagers who have premarital sex, to examine what actually happens in their relationships with each other.

#### [Adolescent Sexuality; 1998 to 2003] DAVID L. WEIS

[One of the most popular and controversial areas of sex research in the U.S.A. continues to be adolescent sexual behavior. As a general guide, we can suggest there is growing recognition that social context, interpersonal relationships, and physical development all have an influence on whether sexual intercourse occurs, at what age, and with what outcomes or consequences. Susan Newcomer (2002) has provided a useful summary of recent research. She notes that 1. boys tend to begin having intercourse earlier than girls, 2. youth who reach puberty earlier tend to have intercourse earlier, 3. African-American youth tend to have intercourse earlier than either Hispanic or white youth, 4. youth from poor households tend to have intercourse earlier, 5. youth who have intercourse for the first time before the median age are less likely to use protection against disease or pregnancy, 6. girls tend to have male partners for intercourse who are slightly older than the girl (this is true of marriage, as well), and 7. condom use by adolescents has increased in the last decade. She also notes that, while it is popular to blame the media for the sexual adventuring of youth, there are no scientifically sound studies which demonstrate that consumption of sexually explicit media has any effect on sexual behavior. I would like to stress that Newcomer’s comments apply only to sexual intercourse specifically.

[Much has been made, in some quarters, of a decline in the percentage of sexually active high school students in recent years (Centers for Disease Control 2002). By 2001, the percentage of high school students who have had sexual intercourse dropped by about 6% to slightly below 50%. The drop was more pronounced for black teens. Still, 55% of 11th graders in a recent study in Toledo, Ohio, reported hav-

ing had intercourse. One third said they had intercourse with a friend. The rate would have been higher if questions about oral sex had been included (Stepp 2003). A recent poll by *The New York Times* found that 20% of American teens do have sexual intercourse by age 15. Most of these sexually active 12- to 14-year-olds were using contraceptives. About one third of their parents knew they were having intercourse. Data in the report came from the *National Survey of Family Growth*, the *National Longitudinal Survey of Adolescent Health*, and the *National Longitudinal Survey of Youth* (Lewin 2003). So, reports of a possible decrease should be interpreted with caution.

[In fact, this point needs to be considered in the light of two additional findings. One is the evidence that American teens may only be postponing the onset of intercourse (which has mistakenly come to be described as sexual debut), catching up to the levels of the late 1980s by age 21 (CDC 2002). Here, it is worth noting that there have been no published studies documenting any such decline among college students. The other is the fact that this constant focus on sexual intercourse as the only sexual behavior of interest actually serves to distort adolescent sexual development, a point I made two decades ago (Weis 1985). Teens engage in a wide variety of noncoital sexual behaviors before they have intercourse. Moreover, the constant focus on intercourse, to the exclusion of other sexual behaviors, may actually have hidden one of the major trends in adolescent sexuality of the last decade. This has been the tremendous growth of oral sex as a practice in its own right (Paul & Hayes 2002). Thus, the rate of American adolescents engaging in sexual behaviors leading to the orgasm of one or both partners has actually increased in the last 15 years. About one third of 15- to 17-year-olds and two thirds of the 18- to 24-year-olds in a recent Kaiser Foundation study reported they had oral sex (Hoff & Greene 2000). The reality is that there is a major development in adolescent sexual practices that does not involve intercourse.

[Finally, the focus on the percentage of teens having (or not having) intercourse has served to obscure two additional trends of the last decade. Contraceptive behavior increased and pregnancy rates decreased among high school students in the 1990s (Meschke, Bartholomae & Zentall 2000). The U.S.A. now has the lowest teenage pregnancy rate in more than a half century.

[To highlight the political nature of this area, we can point to a recent Heritage Foundation report in June 2003 using Add Health datasets (age 14 to 17), but not citing any prior refereed studies nor reporting any actual statistical analyses. They claimed that teenagers who have sexual intercourse are more likely to report suffering from depression and to attempt suicide than abstinent teens (Rector, Johnson, & Noyes 2003).

[There have been a few other recent indicators with relevance to adolescent sexuality. A 2000 report of a series of national surveys of teenagers, parents, teachers, and school principals by the Kaiser Family Foundation provides impressive evidence that strides have been made in providing American youth a comprehensive sex education in schools. In contrast to 50 years ago, virtually all American public schools now offer some form of sex education. By far, the most common approach is to provide a comprehensive perspective that includes information about contraceptives, sexually transmitted diseases, and basic anatomy and physiology, in addition to recommendations to remain abstinent. Less than one half of the programs provided any information about homosexuality or how to discuss sex with a partner. About one third of principals described their programs as abstinence-only (Hoff & Greene 2000). Even for advo-

cates of comprehensive sex education, I would maintain that this represents important gains since 1970 (when I entered the field). Kirby (2002) has also noted that involvement in education is associated with lower pregnancy rates and lower sexual risk-taking, that sex education programs are not associated with increases in sexual behavior, but are associated with increased contraceptive and condom use.

[One way of reading recent studies is that teens who believe sexual activity is appropriate and acceptable are, in fact, more likely to engage in sexual behavior, particularly if they have opportunities (Gillmore, Archibald, Morrison, Wilsdon, Wells, Hoppe, Naliom, & Murowchick 2002; Whitbeck, Yoder, Hoyt, & Conger 1999). It does appear that about 80% of American youth do now have sexual intercourse by age 19 (Singh & Darroch 1999).

[There have been some important recent developments in the field of sexuality research. We have begun to finally see an expansion of research on teenagers beyond the standard WASP populations (Moore & Chase-Lansdale 2001; O'Sullivan & Meyer-Bahlburg 2003; Raffaelli & Green 2003). There even has been some expansion of the creativity of hypotheses tested and explanations investigated (Levin, Xu, & Bartkowski 2002). Using *National Longitudinal Study of Adolescent Health* data, Levin and his associates found that there are two predictable peaks of coital debut during each year. One is a summer peak, not associated with involvement in a romantic relationship. The other is a holiday peak, occurring in December and associated with involvement in a romantic relationship, especially for girls.

[*The Context of Sexual Relationships and Courtship: Hanging Out, Hooking Up, and Buddy Sex.* In the original edition of the *Encyclopedia*, I asserted that researchers have largely ignored the relationship context surrounding adolescent sexuality and that most adolescent sexual experiences occurred within intimate relationships. At one time, there was a good understanding that adolescent males and females went through a fairly predictable sexual and courtship sequence. Bailey (1989) has summarized this well. Couples met, were attracted, began dating, went steady, and eventually became engaged and were married. At some time in this sequence, they became sexually involved as well. Through the course of the 20th century, the stage where sexual intercourse began started moving to earlier points in the sequence. As late as the 1960s, sexual experimentation tended to take place during the college years. This courtship system can be traced as far back as the 1920s and flourished through the 1950s and 1960s, extending into the 1980s (Bailey 1989). The pattern of going steady or going together (exclusive intimate relationships) seems to have remained popular well into the 1980s. However, questions can and should be raised about the extent to which this system even exists today.

[Nearly two decades ago, Carol Cassell (1984) used the term, "swept away," to describe what she maintained was a chief sexual fantasy (script) for women in America. She argued that young women were socialized to pair sexual excitement with passion, to wrap sexual desire in a cloak of romance. This is the stuff of song, movies, books, and magazines. It is the very core of the entire romance industry. According to Cassell, the swept away script allowed women to deny responsibility for their own sexual decisions and activity. The strategy allowed young women to gain sexual experience in a society that was still uncomfortable with female sexuality. However, it now seems appropriate to question whether the concept of being swept away is still relevant in 2003, and if so, for whom?

[In fact, there has been relatively little research on dating and courtship for decades. Several recent publications call our understanding of this 20th-century concept of courtship into question (Glenn & Marquardt 2001; Hall 2003; Harris 2003; Stepp 2003). Each of these authors indicates that young people today tend to "hang out" in small groups, because "there is nothing to do" (Hall 2003). Quite often, this happens in house parties accompanied by drinking where people "hook up" with whomever. Hooking up is intentionally vague and may be used to refer to kissing, petting, oral sex, or intercourse. One can never be certain about its precise meaning (Glenn & Marquardt 2001; Hall 2003). Few young people consider oral sex to be sex at all (the Bill Clinton standard), and intimate relationships are widely seen as a great responsibility. Apparently, hooking up is seen as easier (Hall 2003).

[Despite the prominence of this hanging out script, most college women today still appear to hold marriage as a major life goal. Women outnumber men on college campuses. In 1997, there were 79 male college students for every 100 female students. Male-female relationships are now either characterized by a high degree of commitment (exclusivity) or very little (nonexclusive friendship). Hooking up is widely seen as a "sex without commitment" interaction. College men rarely ask women for dates. Only about 50% of college women report they have been asked for as many as six dates during their four years of college. Coed dorms are the most common place to meet partners and to hang out. The culture of courtship has largely become the culture of hook ups (Glenn & Marquardt 2001).

[Within this culture, it appears that many young people today may make a distinction between casual sex and relationship sex, and may have both. Casual sex may occur with friends, or with friends from different groups of friends, what Stepp (2003) called "buddy sex." Young women, in particular, now appear to believe that they have every right to enjoy sex in whatever form they choose—à la *Ally McBeal* or *Sex in the City* (Glenn & Marquardt 2001; Stepp 2003; Webb 2002). As a result, much teen sex may no longer be connected to the courtship system, especially since dating implies exclusivity for most young people today. There no longer appears to be any concept of dating around. Dating implies serious involvement.

[In one of the few actual studies of these patterns, Glenn and Marquardt (2001) reported that college women whose parents were divorced were more willing and more likely to hook up, although they were also more eager to marry early. Given that the current generation of adolescents and young adults has grown up against the background of a high divorce rate, and given that the median age of first marriage is now in the late 20s, it makes sense that new forms of male-female relationships would be emerging. Glenn and Marquardt (2001) have raised questions about whether this pattern of hooking up with "buddy sex," a "sex friend," or a "friend with privilege" provides adequate preparation and training for marriage. One could just as easily ask if the traditional courtship script provides adequate training for the realities of contemporary intimate relationships.

[At the same time, I would like to suggest that these informal and unstructured forms of sexual interaction are not as new or unique as one might think. At least as far back as the 1960s, hippies (the Haight-Ashbury scene is just one example) began experimenting with new forms of male-female pair bonding. Libby (1977) described a script for "getting together" as a substitute for the practice of dating. "Getting together" was defined as an unstructured activity that allowed men and women to sexually interact without the formal protocols of dating or the expectations of exclusive

intimacy. Rather, sexual interaction might be seen as friendship or mutual pleasure. Thus, such scripts have existed within American culture for some time. In any event, there is great need for more research in this general area. Given the immense changes in sexual practices and intimate relationships among adults in the last century, it only makes sense that adolescent practices will also change. (*End of update by D. L. Weis*)]

### C. Adult Heterosexuality DAVID L. WEIS *The National Health and Social Life Survey*

Strangely, there has been considerably more research on the sexual conduct of American adolescents than of adults, and much of the existing research on adults has tended to focus on sexual “problems” such as extramarital sex (ES) and sexual dysfunction (see Section 12 on sex dysfunctions and therapies). There has been little research on the patterns of sexual interactions within nonclinical marital relationships. This is striking, precisely because of the fact that marriage is the most widely accepted setting for sexual relations in the U.S.A. and because more than 90% of Americans do marry. Taken together, the preponderance of research on adolescent sexuality, extramarital sex, and dysfunction indicates the tendency of American sexuality professionals to focus on sexual behaviors that have been defined as social problems, rather than on “normal” sexuality.

In October 1994, a national survey of adult sexual practices was released with great media fanfare (Laumann, Gagnon, Michael, & Michaels 1994). The survey, titled the *National Health and Social Life Survey (NHSL)*, randomly sampled 3,432 persons, aged 18 to 50. It was touted as the most comprehensive American sex survey ever, and the first national study of adult sexuality. However, Reiss (1995) has noted that this claim is misleading, as there have been more than a dozen national surveys of a more-limited scope. Given our interest in reviewing the nature of American sexuality research, it is interesting to note that the survey was originally planned and approved as a government-sponsored project. Funding was denied for this project and a similar study of teens (the Udry study) when conservatives in the U.S. Congress objected to the studies. Conservatives argued that the government should not use taxpayer money to study private matters like oral sex—clearly rejecting the significance of the health concerns involved. The researchers found private funding instead. Also interesting is the fact that conservatives hailed the findings when the study was released (Peterson 1994).

There is little doubt that the *NHSL* is the most comprehensive study of adult sexuality to date, with literally hundreds of variables assessed. Among the key findings are the following:

- Most Americans report that they are satisfied with their sex life—even those who rarely have sex. Among married persons, 87% reported they were satisfied with their sex life.
- For the entire sample, 30% of men and 26% of women have sex two or three times a week; 36% of men and 37% of women have sex a few times a month; and 27% of men and 30% of women have sex a few times a year. Married persons have sex more often than single people, and persons who are cohabiting have sex more often than marrieds.
- Approximately 80% of married women and 65% of married men have never had extramarital sex. The majority of those who are cohabiting also have never “cheated.” The group most likely to have extradyadic sex is unmarried men, aged 42 to 51, who have lived with a woman for three years or less (32%).
- There has been a slight increase in the number of lifetime sexual partners, largely because people now have intercourse earlier, marry later, and are more likely to get divorced.
- Among marrieds, 94% had sex only with their spouse in the last year; 75% of cohabiting persons had sex only with their partner in the last year. About 80% of American adults have had either one or no sexual partners in the last year. Only 3% have had five or more partners in the last year. About 50% of men and 30% of women have had five or more partners since age 18.
- Most Americans have a fairly limited sexual “menu” of activities. Roughly 80% of both men and women reported that sexual intercourse is very appealing; only 50% of men and 33% of women find receiving oral sex appealing; 37% of men and 19% of women describe giving oral sex as appealing. About 25% of both men and women have tried anal sex at least once.
- People who already have an active sex life with a current sexual partner are more likely to masturbate. Among married people, 57% of husbands and 37% of wives have masturbated in the last year.
- About 2.8% of men and 1.4% of women identified themselves as homosexual or bisexual. Only 9% of men and 4% of women reported ever having a homosexual experience. These rates are considerably higher in the 12 largest U.S. cities.
- Most heterosexuals are not at risk of contracting AIDS, because they are not part of social networks with high risk.

The *NHSL* has sparked considerable controversy among sexuality professionals. Questions have been raised, primarily about the legitimacy of the prevalence estimates for such behaviors as number of sexual partners, homosexual experience, and extramarital sex. In general, the *NHSL* estimates tend to be lower than those found in most prior sex research—including prior national studies (Billy, Tanfer, Grady, & Klepinger 1993). It should be noted that the *NHSL* estimates are remarkably similar to findings in a series of studies conducted by the National Opinion Research Center using similar national probability samples (Davis & Smith 1994; Greeley et al. 1990; Smith 1990, 1991). These national samples have been carefully constructed to be representative of gender, age, race, education, marital status, size of city of residence, and religion in the U.S.A. The *NHSL* did obtain a 79% response rate, probably because participants were financially reimbursed. Few prior studies have had comparable response rates, and few have reimbursed participants. Questions about how this had an impact on the results are a legitimate matter for future research.

In a review of the *NHSL*, Reiss (1995) credits the study for its comprehensiveness, the richness of the data generated, the theoretical nature of the investigation, and the high quality of the sampling techniques. However, he also raises several questions that may influence the validity of the findings. Here, we will focus on a few of the more serious. One concerns the fact that 21% of the respondents were interviewed with someone else present during the interview. As Reiss notes, a person with an intimate partner or a family member present may well have answered questions differently for obvious reasons. For example, only 5% of persons interviewed with another person present reported that they had two or more sexual partners in the last year. In contrast, 17% of those interviewed with no one else present reported two or more partners in the last year. This is a sizable difference, and it raises questions about the validity of responses to many questions in the survey. Similarly, the *NHSL*

asked respondents to report the number of sexual partners they have had since age 18. Most previous studies asked respondents to report their lifetime number of sexual partners. Here, one half of the sample did have sexual relations prior to age 18. This reduced estimates for lifetime number of partners. The *NHSLS* reported a median number of six sexual partners for men and two for women. Reiss notes that these estimates are lower than comparable studies (Billy et al. 1993), and that this reported gender difference cannot possibly be true in the real world.

To this critique, we can add that it is possible that prevalence estimates have been inflated by the volunteer bias of most sex research. There are unexamined questions about the effects of volunteer bias and response rates. Paul Gebhard (1993), a member of the original Kinsey research team, has argued that estimates of lifetime prevalence rates for homosexual behavior have been remarkably similar when adjusted for sampling weaknesses. Gebhard also criticized the NORC and *NHSLS* studies for failing to use trained sex researchers to conduct their interviews, and for their own sampling flaws that overrepresented rural populations. In fairness, it is appropriate to note that several of the volunteer samples overrepresent urban populations, and there is evidence that urban-rural differences in sexual attitudes remain substantial (Weis & Jurich 1985). Finally, although there is a general consensus that persons who agree to participate in sex research are more permissive and more sexually experienced, two recent studies strongly suggest that persons who decline to answer particular items in a sex survey are attempting to hide behavior in which they have engaged (Wiederman 1993; Wiederman, Weis, & Allgeier 1994).

Although these questions will require considerable future research to resolve, it should be acknowledged that the *NHSLS* is a major contribution to the field of sex research in the U.S.A. It is a landmark study with important new information about the sexual practices of the vast and diverse American adult population, and it will set the parameters for questions yet to be explored. Finally, it provides important data on each of the topics we will explore further in this section.

### *Sexuality and Single Adults*

Practically every American spends at least a portion of his or her adult life unmarried. At any one point in time, more than 20% of the U.S. population is single, and this percentage has been increasing for several decades (Francoeur 1991; Shostak 1987). The chief reasons for this are the greater tendency to postpone marriage (median age is now in the late 20s), the increasing divorce rate (5 per 1,000 by the 1980s and fairly stable thereafter), and the increasing rate of cohabitation (which tripled since 1960), both as an alternative to marriage and as a form of courtship prior to marriage (Glick 1984; Norton & Moorman 1987; Shostak 1987). Glick (1984) has speculated that the prolongation of formal education, the increasing acceptability of premarital sexuality, the growing independence of women, and the earlier mortality of males may also be factors promoting the growth of singlehood.

Actually, the single adult population contains three groups who may share little in common: Those who have never married, those who have divorced, and those who are widowed. Persons within each group may or may not have chosen to be single, and they may or may not intend to remain single. Also, persons in each group may be living alone, may be living with roommates who are not intimate or sexual partners, or may be cohabiting with an intimate partner. By 1980, it was estimated that close to 2% of the adult U.S. population was cohabiting (Glick & Norton 1977;

Yllo 1978). Of course, some single persons are gay or lesbian, although they are not typically included in estimates of cohabitation, even when they live with their partners.

It should be stressed that the population of single adults is a fluid one. The U.S.A. has high rates of marriage, divorce, and remarriage (Glick 1984; Norton & Moorman 1987). Most of those who are classified as having never married at any one point will eventually marry. This is especially true for the growing group who have remained unmarried well past the age of 20. Approximately three quarters of women who get divorced, and more men, eventually remarry (Glick 1984; Norton & Moorman 1987). Thus, the composition of the single population is always shifting as some marry and others divorce or are widowed. We are not aware of any research examining the impact of this shifting character on the sexual lifestyles of single persons. Some singles become involved in intimate relationships that lead to cohabitation or marriage, although we know little about whether these processes are similar to adolescent courtship. For those singles who are not involved in an ongoing intimate relationship, it is possible that finding sexual partners can be problematic.

It is popularly believed that being single in adulthood has become more acceptable in the United States today. There is, however, some evidence that married couples continue to associate primarily with other couples. Certainly, it is more acceptable to be sexually active while single today. Singles have greater social and sexual freedom than ever before to pursue a variety of lifestyles. In fact, the labeling of a category of "single adults" may serve to obscure the fact that the range of sexual and intimate lifestyle options is just as wide as for married persons.

Despite the large number of single adults in the U.S., there has been virtually no research on the sexual practices or attitudes of these groups. The *NHSLS* (Laumann et al. 1994) did distinguish between "single" and cohabiting respondents, an important distinction. As we discussed earlier, the *NHSLS* did find that "single" persons had sex less frequently than married persons, and that cohabiting persons had sex more often than married persons.

### [*Cohabitation*

ROBERT T. FRANCOEUR

[*Update 2003:* America is still a society devoted to marriage, with 55.4 million married couples accounting for 52% of the households. But the 1990 and 2000 censuses show that the number of unmarried couples rose from 3.2 million in 1990 to 5.5 million in 2000, a very significant 72% increase. The change clearly indicates continuing changes in mores and more-fluid living arrangements. The change is also alarming to conservatives and President Bush, who want to amend the tax laws that penalize married couples, and also promote welfare rules they believe will encourage marriage and family unity.

[The census of 2000 was the first to ask questions about same-sex households, so the same-sex statistics are difficult to interpret. Gay activists claimed their numbers were "dramatically underestimated," but this could be because of differences in the 1990 and 2000 censuses, and the reluctance of gays to admit their household status on the first such census to ask about same-sex households. Same-sex couples tend to gravitate to the larger cities, especially if they live in the west or midwest.

- California is home to one in eight of the nation's unmarried partners. Alaska is second, with 12%, and Maine, Vermont, and Nevada third, with 11% (see Tables 12 and 13).
- California also has 16% of the nation's same-sex couples, 54% of which are male. Utah had the fewest same-sex couples, 4%, followed by Alabama at 5%.

- Opposite-sex unmarried couples are 12 years younger than their married counterparts, perhaps because Americans are marrying later in life.
- The average age of unmarried-partner households was 37 years for men and 35 for women. Husbands averaged 49 years and wives 47 years. Single-sex couples were mostly in their 40s (Marquis 2003). (*End of update by R. T. Francoeur*)

*The Never Married.* We know of no research that has focused on the population of never-married adults who are not cohabiting. Of course, this group does include persons in their early 20s who have yet to marry. A portion of that group is included in many of the studies of premarital sexuality, although that group is not isolated for separate analysis. There is virtually no scientific information on how never-married persons find or meet sexual partners, establish sexual encounters, or maintain sexual relationships.

**Table 12**

**Unmarried-Couple Households by State, as a Percentage of All Couple Households**

Percent	States

[*Marriage and Child Support Efforts. Update 2003:* Early in 2003, as part of his "faith-based initiative," President Bush used an executive order to bypass a reluctant Congress and authorize \$2.2 million in grants to 12 states and a variety of religious, nonprofit, and tribal organizations to advance the nation's child support enforcement system and promote marriage. Bush's assurance that no government money "will be used to directly support inherently religious activities" has not satisfied skeptics, who are concerned some of the grants may violate the constitutional separation of church and state.

[According to the commissioner of the Office of Child Support Enforcement, "These are grants to government and community organizations, including faith-based organizations, that want to try interesting new program approaches to improve the child support program and financial well being of children," Heller said. A spokesperson for one grant recipient described her group as "a nonprofit organization of inter-religious clergy, mental health professionals and individuals dedicated to reducing the divorce rate and birth to unmarried parents through education." The group, which advocates marriage, is not a religious organization, but it does train clergy and counselors to help engaged and wedded couples. "People go to churches. Seventy-five percent of people who get married get married at churches so that's where our customers are." Another grant to an agency in Alabama was aimed at strengthening marriage, by helping poor, ethnically diverse single parents learn marital skills, improve their employment prospects, and increase child support payments (McDonough 2003). (*End of update by R. T. Francoeur*)

*Divorced (Postmarital Sex).* Divorce has increased in the U.S.A. dramatically throughout the 20th century (Berscheid 1983). The rate has leveled since 1980 (*Current Population Reports* 1985; Glick 1984; Norton & Moorman 1987; Shostak 1987). Of the roughly 40% of the American population that gets divorced, about 70% eventually remarry, often within a few years (Glick 1984; Norton & Moorman 1987).

Again, there has been little research on this group. It appears that about 80% of women, and nearly all men, remain sexually active following a divorce (Gebhard 1968; Hunt 1974). Most persons have sex with a new partner within the first year following a divorce (Hunt 1974). In the 1970s, Hunt (1974) reported that divorced women averaged four sexual partners a year, and had a higher frequency of orgasm in their postmarital sex than they had had in their marriage. Men averaged nearly eight partners a year.

Again, there has been little research on the process by which divorced persons form or maintain sexual relationships. However, it is fair to suggest that, as the title of an American novel and corresponding movie implies, most divorced persons find that they must "start over." After a period of marriage, they find themselves in the position of dating and courting again. Some have anecdotally reported that they find this anxiety-provoking, whereas others find it exhilarating.

*Widowed.* This process of "starting over" may be relevant to those persons who are widowed as well. Our review of the research literature identified only one study of the sexual practices of widowed persons. Nearly three decades ago, Gebhard (1968) reported that widowed persons were less likely to have sexual experiences than divorced persons. Francoeur (1991)

has suggested that this may be in part because of a sense of loyalty to the former spouse or to perceived and real pressure from kin members.

### *Marital Sex*

By far, the most common adult sexual lifestyle in the U.S.A. is legal marriage, and marriage is the context for the overwhelming majority of sexual experiences in the country. In fact, marriage is the only context in which sexuality is universally approved. Despite this, researchers have investigated marital sexuality less than nonmarital forms of sexual expression. Greenblat (1983) has suggested that sex within marriage is more likely to be the object of jokes than of scientific investigation. Strong and DeVault (1994) report that only nine of 553 articles on sexuality that appeared in scholarly journals between 1987 and 1992 were devoted to marital sexuality.

This pattern of research is somewhat odd in light of the widespread belief that effective sexual functioning is indispensable to a good marriage (Frank & Anderson 1979). In this regard, it is striking that much of the research conducted on couples has utilized clients in sex therapy. Here we review works on nonclinical samples.

*Sexual Frequency and Practices.* Most of the research on sexual relations within marriage has assessed the frequency of sexual relations. Many of these studies have also examined how that frequency is related to marital satisfaction. Americans seem to be fascinated with comparing their own frequency to other couples. Until recently, this research was based on volunteer samples, which typically were also quite small.

Perhaps the first sex survey ever conducted in the U.S.A. was done by Clelia Duel Mosher (1980), who investigated the sexual practices and attitudes of 45 women between 1890 and 1920. Most of these women reported that they found sex to be pleasurable and believed that it was "necessary" for both men and women. The women who were interviewed before 1900 were less likely to describe sex as important or enjoyable, and they were less likely to associate sex with the expression of love. The Mosher survey documents the first signs of a shift to a post-Victorian culture.

In a study of more than a thousand men and women, Dickinson and Bean (1932) reported that sexual dissatisfaction was more important in explaining marital difficulties than disputes over work, money, and children. Davis (1929) drew similar conclusions in her study of 2,200 women. Sexual satisfaction within marriage had clearly become a norm in the U.S.A. by the early 20th century. Somewhat later, Hamilton (1948) interviewed 100 married men and women and concluded that an unsatisfactory sex life is the principal cause of marital dysfunction. Without addressing the validity of that particular claim, the Hamilton data do demonstrate that, in the small sample surveyed in the 1930s and 1940s, sex was considered to be an important part of a marriage.

The Kinsey group (1953) reported that married couples in the 1940s had sex an average of two times a week in the early years of marriage, declining to about once a week after ten years of marriage. By comparing those born before 1900 and those born after 1900, they found that the frequency of marital coitus had remained the same. However, virtually every other aspect of marital sex had changed. Couples born after 1900 engaged in more and longer foreplay, used more coital positions, were more likely to have oral sex, were more likely to use French (deep) kissing and manual caressing of genitals, and had sex more often naked.

More-recent studies have tended to fit two patterns. Small samples with volunteers have found a general average of three to four times a week in early marriage with a de-

cline to twice a week in later years. However, studies with national samples have tended to get lower figures more like Kinsey's (Bell & Bell 1972; Blumstein & Schwartz 1983; Call, Sprecher, & Schwartz 1995; Hite 1976, 1983; Hunt 1974; Sarrel & Sarrel 1980; Tavris & Sadd 1974; Trussell & Westoff 1980; Udry 1980; Westoff 1974). Interestingly, married women tend to report lower frequencies than married men (Call et al. 1996).

A few researchers have asked respondents to report their ideal or preferred frequency. Hite (1976) found that one third of married women would like to have sex at least daily, another third wanted it two to five times a week, and a final third less often.

*1. Changes Throughout Marriage.* The evidence of a decrease over time or length of marriage is strong and consistent (Blumstein & Schwartz 1983; Edwards & Booth 1976; Greeley 1991; Hunt 1974; Kinsey et al. 1953; Michael et al. 1994; Trussell & Westoff 1980; Westoff 1980). Longitudinal studies of the same couples over time have also documented this pattern (James 1981; Udry 1980), as have retrospective studies of couples looking back over the course of their marriage (Greenblat 1983).

In a national study of the 1988 *National Survey of Families and Households* (Call et al. 1995), frequency decreases over the length of marriage were correlated with biological aging, diminished health, and habituation. In a multivariate analysis, age was most strongly related to frequency, followed by marital happiness, and factors that reduce the opportunity for sex (such as pregnancy and small children). Couples who had not cohabited prior to marriage and who were still in their first marriage had less-frequent sex than cohabiters, married persons who had cohabited prior to marriage, and those who were in their second or later marriage.

These findings are largely consistent with prior research. Decreasing frequency of marital sex has been found to relate to age-related reductions in the biological capacity for sex, including declines in male motivation and physical ability, declines in women's testosterone levels, and increases in illness (Greenblat 1983; Hengeveld 1991; James 1983; Udry, Deven, & Coleman 1982). Negative social attitudes about sex and the elderly may also lead some to believe that their interest and capacity should decline (Masters & Johnson 1970; Riportella-Muller 1989). However, these aging factors do not explain the decline in frequency that occurs within the first several years of marriage (Jasso 1985; Kahn & Udry 1986). James (1981) found that the coital rate dropped by one half during the first year of marriage. Some have suggested that there is a honeymoon effect early in the marriage. As the honeymoon period ends, habituation occurs and frequency declines (Blumstein & Schwartz 1983; Doddridge, Schumm, & Berger 1987). Habituation may be seen as a decreased interest in sex that occurs with the increased accessibility of a regular sexual partner and the routine predictability of behavior with that partner over time (Call et al. 1995).

Other reasons that have been cited as influencing a decrease in frequency include fatigue, work demands, childcare, and management of complex schedules (Michael et al. 1994).

*2. Effects of Children.* A few comments on the effects of children are worth special note. There is some evidence that sexual frequency declines by the third trimester of pregnancy—prior to the actual birth of a child (Kumar, Brant, & Robson 1981). The birth of a child introduces parental roles into the marital relationship. The child increases fatigue, reduces time alone together for the couple, and decreases time in situations that are conducive to sexual encounters (Blumstein & Schwartz 1983; Doddridge et al. 1987; Greenblat 1983).

3. *Association with Sexual and Marital Satisfaction.* A majority of Americans report that they are satisfied with their marital sex life (Hunt 1974; Lauman et al. 1994). In general, researchers have not found frequency to be related to sexual or marital satisfaction (Blumstein & Schwartz 1983; Frank, Anderson, & Rubinstein 1978). However, there is evidence that the congruence between ideal and actual frequency is related (Frank & Anderson 1979). There is some evidence that sexual problems are likely to occur fairly early in a marriage (Brayshaw 1962; Murphy et al. 1980).

Some studies have found social factors associated with relationship satisfaction. Rainwater (1964) found, in a study of couples in poverty in four different cultures, that lower-class couples were more likely to have highly gender-segregated role relationships (traditional gender roles); they were less likely to have close sexual relationships, and the wife was not likely to view sex with her husband as gratifying.

Several studies have found that sexual satisfaction is related to both sexual and nonsexual aspects of the marriage. The Kinsey group (1953) found that divorce was related to decreases in the wife's orgasm rate. Hunt (1974) reported a strong correlation between marital closeness and sexual satisfaction. He found that the most important predictor was the extent to which couples share similar sexual desire. Thornton (1977) found that couples who spend more time having sex than they do fighting tend to have happier marriages. Sarrel and Sarrel (1980) found that couples who talk with each other about sex often, who rate their communication about sex as good, where the wife likes oral sex, and where the man believes the women's movement has been good for women tend to have more satisfying sexual relationships.

Hite (1976) asked women to identify what aspect of their marital sex gave them the greatest satisfaction. Responses given by 20% or more included closeness, orgasm, coitus, and foreplay. In response to what they liked least, more than 10% said oral or anal sex, lack of orgasm, the "messiness" following sex, excessive or rough foreplay, and the routine nature of their activities.

In the *Redbook* magazine surveys (Tavris & Sadd 1975; Tavris 1978), marital satisfaction did not decline with length of marriage or age. The majority reported enjoying oral sex. Most respondents believed that good communication is an important ingredient of marital and sexual happiness. The most common complaint was that they had sex too infrequently. For women, religiosity was related to a happier sex life and marital satisfaction.

In an unusual study of 100 mostly white and well-educated couples who were happily married (selected because none had ever had extramarital sex or been in therapy), Frank and Anderson (1979) found that 85% described themselves as sexually satisfied. One half of the wives reported they had difficulty becoming aroused or reaching orgasm. Roughly 10% of the husbands reported they had experienced erectile difficulties. One third of the couples expressed complaints about such things as anxiety, too little foreplay, and low sexual desire. There was no correlation between sexual dysfunctions and marital satisfaction, but complaints by the wife were associated with reduced marital happiness.

4. *Unexplored Issues.* This review of research on marital sexuality serves to confirm the narrow range of the questions researchers have investigated. We know little about the dynamics of sexual relationships in marriage—about the ways couples interact sexually, about how they transact or negotiate sexual encounters, or about how they initiate and terminate encounters. Little is known about how sexuality in marriage is affected by power dynamics between the

couple. There has been little study of sexual coercion in marriage. Perhaps it is time to end the focus on counting episodes and begin to examine what happens within marital sexual relationships.

*Extramarital Sexual Relationships.* Researchers have been studying extramarital sex for decades, although the range of the questions they have examined has been fairly narrow. (For more-thorough reviews of extramarital sex research and nonexclusive lifestyles, see Macklin 1980; Thompson 1983; Weis 1983.)

1. *Extramarital Sex Attitudes.* One focus of concern has been the degree of normative consensus reflected by extramarital sex attitudes. A series of national surveys indicate that extramarital sex has consistently been disapproved by 75% to 85% of the adult American population (Glenn & Weaver 1979; Greeley, Michael, & Smith 1990; Reiss, Anderson, & Sponaugle 1980; Weis & Jurich 1985). Weis and Jurich (1985) found that nearly one third of residents in the 12 largest cities found extramarital sex acceptable, the only locations in the U.S.A. where as many as 20% approved. In small towns and rural areas, fewer than 10% approved. The norm of sexual exclusivity within marriage is so widespread in American culture that few question it.

Approval of extramarital sex has been found to be related to 1. being male, 2. young age, 3. being nonwhite, 4. living in a large city, 5. high levels of education, 6. low religiosity, and 7. being unmarried (Glenn & Weaver 1979; Reiss et al. 1980; Weis & Jurich 1985; Weis & Slosnerick 1981). Although a number of researchers have reported that approval of extramarital sex is related to lower levels of marital happiness, Weis and Jurich (1985) found that marital happiness was less strongly related to extramarital sex attitudes than several of these other variables.

2. *Extramarital Sex Incidence/Prevalence.* A second major concern of researchers has been the attempt to establish estimates of the prevalence and/or incidence of extramarital sexual behavior. Generally, this has taken the form of asking respondents to indicate whether or not they have ever had extramarital sex. Authors have regularly claimed that roughly one half of married persons in the U.S.A. have had at least one extramarital sex experience, citing the Kinsey research (1948, 1953) as the basis for this claim. Although the point is often ignored, the Kinsey team actually found that 33% of husbands and 26% of wives reported having extramarital sex. Because of suspicions of underreporting, they raised the estimate for male—but not female—extramarital sex to 50%. Several researchers have reported that the figures for husbands have remained "fairly stable" since then, but that the rate for wives has increased to approximately that of husbands (Blumstein & Schwartz 1983; Hunt 1974; Levin 1975). Researchers have reported lifetime prevalence rates from as low as 20% (Johnson 1970) to nearly 75% (Hite 1981).

Several recent studies by the National Opinion Research Center (NORC) (Smith 1990, 1991; Greeley et al. 1990) have found that only 2% to 3% of American married men and women have extramarital sex each year. Further, they reported that 65% of wives and 30% of husbands have the same number of lifetime sexual partners as spouses. According to these researchers, the increases in premarital sex and cohabitation, the rising rate of divorce, and the later age at first marriage that have characterized the last 40 years have resulted in less sexual exclusivity among the unmarried, but no such trend has occurred among married persons in the U.S.A. The Greeley group concluded that Americans are overwhelmingly "monogamous" [sic] and that rates of

extramarital sex have been overestimated by previous researchers. *The National Health and Social Life Survey* (Laumann et al. 1994), also conducted by the NORC, found that only 35% of men and 20% of women reported ever having extramarital sex, and 94% had sex only with their spouse in the last year.

As we have already discussed, making comparisons between the results of the NORC national probability samples and previous studies is most difficult. Most previous studies have reported lifetime prevalence rates. The NORC studies have generally reported annual incidence rates. It seems likely that the conditions surrounding the collection of data and the greater representation of rural respondents in the NORC studies led to low estimates. On the other hand, the volunteer nature of most previous studies and their greater inclusion of urban respondents may well have led to high estimates. For the time being, we must conclude that questions about the incidence and prevalence of extramarital sex in the U.S.A. remain largely unanswered.

**3. Marital Happiness.** The third major focus of extramarital sex research has been the attempt to demonstrate an association between extramarital sexual behavior and marital happiness/satisfaction. By far, this has been the most frequently tested hypothesis. As a consequence, there has been little research exploring the circumstances or conditions surrounding extramarital sexual behavior itself or testing alternative hypotheses. A number of researchers have found that extramarital sexual behavior is significantly related to lower levels of marital happiness (Bell et al. 1975; Edwards & Booth 1976; Glass & Wright 1977, 1985; Prins, Buunk, & Van Yperen 1993; Saunders & Edwards 1984). Lower marital happiness has also been found to be related to extramarital sex attitudes (Reiss et al. 1980; Weis & Jurich 1985).

However, the association may not be as strong as these findings imply. The research by Glass and Wright (1977, 1985) suggests that the actual association between extramarital sex and marital happiness may be quite complex. In their earlier study, Glass and Wright (1977) found that husbands who had extramarital sex in the early years of marriage did have lower marital satisfaction. However, there were no differences in marital satisfaction between husbands who had never had extramarital sex and those who began extramarital sex later in their marriages. Interestingly, exactly the reverse was true for wives. There were no differences in marital satisfaction between wives who had never had extramarital sex and those who began it early in their marriages. Yet, wives who began their extramarital sex experiences later in marriage did have significantly lower marital satisfaction. In their later study, Glass and Wright (1985) found that extramarital sex was related to lower marital happiness only for wives. They concluded that male extramarital sex is likely to be more strongly associated with individual factors, rather than marital issues.

The Glass and Wright studies represent a level of complexity that has rarely been seen in extramarital sex research. Few studies have examined the possibility that marital happiness might relate to different types of extramarital sex experiences. As just one example, we can take the case of consensual extramarital sex. In one of the few comparisons of couples who had made an agreement to include extramarital sex in their marriage with couples who did not have this agreement and had a sexually exclusive relationship, there were no significant differences in marital stability, marital happiness, or level of jealousy (Rubin & Adams 1986). Similarly, Gilmartin (1978) found no differences in marital happiness between a group of couples who participated in swinging and a control group of nonswinging couples.

Moreover, Albert Ellis (1969) has made the obvious point, substantiated by all the studies cited here, that some people who have extramarital sex also report high marital satisfaction. In fact, although the two variables have been consistently found to be significantly related, the proportion of extramarital sex variance explained by marital quality variables has tended to be rather small. This may be in part because of the tendency to dichotomize extramarital sex into "ever versus never" categories, thus ignoring the diversity of extramarital sex types. This treatment of extramarital sex as a simplistic construct that uniformly reflects poor marital dynamics may reduce our ability to establish better explanations of extramarital sex. For example, Weis and Jurich (1985) did report that extramarital sex attitudes and marital happiness were significantly related in a series of national probability samples, but they also found that marital happiness was more weakly related to extramarital sex attitudes than several background variables.

#### *4. Exploring the Diversity of Extramarital Sex Experience.*

This failure to recognize the diversity of extramarital sexual experience may be the single greatest obstacle to the development of sound research and theory. Extramarital sex experiences are, in fact, a class of relationship types, every bit as complex as other relationship forms. With few exceptions, American researchers have failed to recognize the historical and cross-cultural evidence that male and female extramarital sexual behavior is universal, despite the strong normative traditions and sanctions against it. They have also largely ignored the cross-cultural evidence that amply demonstrates a wide variety of extramarital sex patterns and normative responses to it (Buss 1994; Fisher 1992; Ford & Beach 1951; Frayser 1985; Murdock 1949).

**5. Specific Aspects of Extramarital Sex.** Ultimately, a full understanding of extramarital sex will require more-thorough investigation of the myriad ways in which extramarital sexual experiences vary. Several factors require additional research. These include:

- *Specific Sexual Behaviors Involved.* Extramarital sex can range from flirting, kissing, and petting to intercourse (Glass & Wright 1985; Hurlbert 1992; Kinsey et al. 1948, 1953).
- *Specific Relationship Behaviors Involved.* Extramarital sexual relationships vary from those in which sexual interaction is nearly the sum total of the relationship to those where sexuality is a minimal component (Hurlbert 1992; Richardson 1985; Thompson 1983, 1984).
- *Number of Extramarital Sex Partners.* In general, the scant evidence available suggests that most Americans have a small number of extramarital sex partners (Bell et al. 1975; Greeley et al. 1990; Kinsey et al. 1953; Pietropinto & Simenauer 1977).
- *Length of Extramarital Sex Relationship.* It appears that most, but certainly not all, extramarital sexual relationships are of relatively short duration and entail less than ten actual sexual encounters, with some evidence that females tend to be involved for longer periods (Bell et al. 1975; Gagnon 1977; Hall 1987; Hunt 1974; Hurlbert 1992; Kinsey et al. 1953; Pietropinto & Simenauer 1977).
- *Level of Involvement.* Extramarital sex ranges from single sexual encounters in which partners know little of each other to highly intimate affairs with characteristics that are quite similar to intimate marriages.
- *Consensual Versus Secretive.* Although most extramarital sex is secretive or clandestine (Gagnon 1977; Hunt 1974), it is important to recognize that some spouses do

know about their partner's extramarital sex activities and expressly agree to permit extramarital sex (see section below on alternatives to traditional marriage) (Blumstein & Schwartz 1983; Thompson 1983; Weis 1983).

- *Motives and Meanings.* There are dozens of motives for extramarital sex. Weis and Slosnerick (1981) demonstrated that a distinction between individual motives (such as adventure, variety, romance, or pleasure) and marital motives (such as revenge against a spouse, marital hostility, marital sex problems, or as an alternative marriage form) was useful in explaining differences in extramarital sex attitudes.
- *Bisexual/Homosexual.* Extramarital sex has usually been assumed to be heterosexual, but there is evidence that at least some extramarital sex is homosexual (D. Dixon 1985; J. K. Dixon 1984).

6. *Gender Issues.* Before discussing theoretical factors for extramarital sex, we want to note that the available evidence strongly suggests that researchers explore the possibility of separate predictive models for men and women. There is evidence that men are more likely to have extramarital sex than women and to have more numerous extramarital sexual encounters (Buss 1994; Glass & Wright 1985), more likely to report extramarital sexual relationships with limited involvement (Glass & Wright 1985; Spanier & Margolis 1983), and tend to have more partners (Buss 1994; Thompson 1983). Men and women may also experience different outcomes. There is some evidence that women are more likely to report experiencing guilt as a result of extramarital sex (Spanier & Margolis 1983). It is possible that women, as a group, are more likely to be motivated to engage in extramarital sexual activities by marital factors and may be more likely to seek intimacy as a primary goal in extramarital sex (Reibstein & Richards 1993). Several studies have found that marital variables are more strongly related to extramarital sex for women than for men (Glass & Wright 1985; Saunders & Edwards 1984). All of these findings indicate that the extramarital sex experiences of men and women may differ substantially.

7. *Building Theoretical Models.* Edwards and Booth (1976) have argued that the context of marital interaction is more important than background factors in explaining the process leading to extramarital sexual involvement. However, Weis and Slosnerick (1981) have maintained that individuals enter marriage with internalized scripts for sex, love, and marriage. Ultimately, the scripts of married persons stem from an interaction of marital dynamics and background factors. Each of these, in turn, is likely to be influenced by one's position within the social structure.

As just noted, there is evidence of a significant correlation between marital happiness and both dichotomous measures of extramarital sex experience and extramarital sex attitudes, although this association has not always been a strong or robust one. In a study of extramarital sex attitudes (approval), Weis and Slosnerick (1981) isolated two orthogonal factors of justifications for extramarital sex. One was a set of motivations for extramarital sex that mentioned aspects of the marital relationship. The other was a set of individual motives for extramarital sex. Both factors were significantly related to approval of extramarital sex, but the individual motivations were more strongly related than the marital motivations.

These findings suggest two possible paths for future research that seeks to elaborate the complex nature of the association between extramarital sex and marital satisfaction. One is to contrast the types of extramarital sexual experiences that persons with individual versus marital motiva-

tions tend to have and to explore how these relate to marital satisfaction and, perhaps, to outcomes of extramarital sexual relationships. The other is to separate happily and unhappily married persons and to investigate the types of extramarital sex experiences and outcomes for each group. It seems reasonable to expect that the two groups might well pursue different kinds of extramarital sexual experiences under different circumstances, with different outcomes.

A second theoretical factor may be background variables. A number of researchers have reported that premarital sexual attitudes and behavior are related to extramarital sexual attitudes and behavior, several arguing that it is the best predictor of extramarital sexual involvement (Bukstel et al. 1978; Christensen 1962, 1973; Glenn & Weaver 1979; Medora & Burton 1981; Reiss et al. 1980; Singh et al. 1976; Thompson 1983; Weis & Jurich 1985; Weis & Slosnerick 1981). Extramarital sex variables have been found to correlate with premarital sexual permissiveness, number of premarital sexual partners, and early premarital sexual experience (low age). Weis and Jurich (1985) found premarital sexual permissiveness was the strongest and most consistent predictor of extramarital sex attitudes in a series of regression analyses with national probability samples throughout the 1970s.

Several questions remain to be explored. Do these findings suggest that there is something particular about premarital sexual interactions with partners that is associated with extramarital sex, or are measures of premarital sex merely indicative of a broader interest in and history of sexual pleasure in various forms? Which of these will prove to be more useful in explaining various types of extramarital sex activities? For example, Joan Dixon (1984) found that female swingers tend to have early and continuing histories of heterosexual involvement, but that they also tend to have early and continuing histories of masturbation and high current sexual frequencies with partners. Gilmartin (1978) also found that swingers tend to have early heterosexual experiences and high sexual frequencies with their spouses. One might conceivably argue that such persons like sex, and extramarital sex is an extension of a broader orientation to pleasure.

A third factor has been suggested by Cazenave (1979), who has criticized work in the area of alternative lifestyles for its emphasis on ideological preference and its failure to explore how structural variables (such as age, gender, and race) may impose external constraints. In fact, there is evidence that extramarital sexual behavior and extramarital sexual permissiveness (attitudes) are related to 1. young age, 2. being nonwhite, 3. low education for behavior and high education for attitudes, 4. low religiosity, and 5. residence in a large city (Fisher 1992; Greeley et al. 1990; Smith 1990, 1991). Several of these associations may, in fact, be quite complex. For example, the Kinsey group (1948, 1953) found that blue-collar males tend to have extramarital sex in their 20s and their behavior diminishes by their 40s. White-collar males with college educations tended to have little extramarital sex in their 20s. This rate gradually increased to an average of once a week by age 50. In contrast, female extramarital sex peaked in the late 30s and early 40s. Finally, there is a need for research that explores the role of such American social trends as the increasing age at first marriage, the growing divorce rate, the unbalanced gender ratio, and greater mobility and travel in extramarital sexual behavior.

8. *Unexplored Issues.* There has been little research to this point on the process of extramarital sexual relationships. For example, there has been little investigation of how opportunities for extramarital sexual involvement occur in a culture with strong prohibitions against extramarital sex.

Cross-sex friendships and interactions have been frequently cited as creating the opportunity for extramarital sex (Johnson 1970; Saunders & Edwards 1984; Weis & Slosnerick 1981), although this has not been empirically tested. The matter is somewhat complicated by the evidence that friendships outside of marriage are associated with higher levels of marital satisfaction (Weis & Slosnerick 1981). Wellman (1985, 1992) has documented how the friendship networks of men have shifted from public spaces (bars, cafés, and clubs) to private homes. This has led to a narrowing of the concept of friendship to emotional support and companionship. Husbands' and wives' networks are now both based in private, domestic space, and many wives actively maintain their husbands' ties to friends and kin. Men get much of their emotional support from women, as well as men, and women get almost all of their support from women. Wellman argues that marriage may impose constraints on men's ability to spend time and be intimate with other men or women. Whether this is related to extramarital sex remains to be explored.

Similarly, little is known about the outcomes of extramarital sexual involvement. Generally, it is assumed that extramarital sexual relationships are short in duration, exploitive in character, and tragic in outcome. For example, it is generally assumed that extramarital sex and cross-sex friendships will be a source of jealousy in a marriage. Although there is a growing body of evidence about jealousy, little research has specifically investigated jealousy in the context of extramarital sex (Bringle 1991; Bringle & Boebinger 1990; Buunk 1981, 1982; Denfeld 1974; Jenks 1985).

*Alternatives to Traditional Marriage.* Although most extramarital sex is secretive, some couples do pursue lifestyles that permit extramarital sex (Blumstein & Schwartz 1983; Thompson 1983; Weis 1983). There is some evidence that consensual extramarital sex is unrelated to marital satisfaction (Gilmartin 1978; Ramey 1976; Rubin & Adams 1986; Wachowiak & Bragg 1980), suggesting there might be different outcomes for the consensual and nonconsensual forms of extramarital sex.

A number of models for consensual extramarital sex have been proposed, particularly during the 1970s. These include swinging (recreational and shared extramarital sex) (Bartell 1971; Gilmartin 1978; Jenks 1985), comarital sex (Smith & Smith 1974), open marriage (O'Neill & O'Neill 1972), intimate friendship networks (extramarital sex within a context of friendship) (Francoeur & Francoeur 1974; Ramey 1976), and group marriage (Constantine & Constantine 1973; Rimmer 1966). Certainly, there are differences among these various nonexclusive lifestyles. We do not have the space to review fully the distinctions among them here (see Libby & Whitehurst 1977; Weis 1983; see also next section on Polyamory and Alternative Non-Monogamy). What unites them for the discussion here is that they all represent a consensual agreement to allow multilateral sexual involvement. As such, extramarital sex is assigned a different set of meanings from betrayal.

Consensual agreements can vary in terms of the degree of sexual involvement desired, the degree of intimate involvement desired, the degree of openness with the spouse, and the amount of time spent with the extramarital sex partner (Sprenkle & Weis 1978). Buunk (1980) studied the strategies couples employ in establishing ground rules for sexually open marriages. The five most common were: 1. primary value placed on maintaining the marriage, 2. limiting the intensity of extramarital sexual involvements, 3. keeping the spouse fully informed of extramarital sexual relationships, 4. approving extramarital sex only if it involves mate

exchange, and 5. tolerating extramarital sex if it is invisible to the spouse. It would be useful to see research on the association between the types of strategies employed and outcomes of extramarital sex.

Interestingly, husbands tend to initiate swinging (Bartell 1971; Weis 1983). There is some evidence that most couples swing for a few years, rather than pursuing it for a lifetime (Weis 1983). Dropouts from swinging report problems with jealousy, guilt, emotional attachment, and perceived threat to the marriage (Denfeld 1974). As far as we know, there have been no studies comparing dropouts and those who enjoy and continue swinging.

The Constantine study (1973) is virtually the only source of data on group marriage in contemporary America. They report that the typical relationship includes four adults. Most enter a group with their spouses, and if the group dissolves, most of the original pair bonds survive. In fact, the original pair bonds retain some primacy after the formation of the group, and this may be a factor working against the success of the group. Jealousy between male partners appears to be a common problem.

Studies of marital models that permit extramarital sex have tended to employ small, volunteer samples with no control or contrast groups for comparison. There is no basis for a firm estimate of the incidence or prevalence of such alternative lifestyles, although Blumstein and Schwartz (1983) suggested that as many as one of seven marriages in the U.S.A. may have some agreement allowing extramarital sex. Despite the vast attention given to these alternative lifestyles in the 1970s, and despite the more recent claims that Americans are "returning to traditional models of monogamous marriage," there is no scientific basis for concluding that these patterns increased in popularity earlier or that they have become less common in the 1980s and 1990s.

### *[Polyamory and Alternative Non-Monogamy]*

JAMES R. FLECKENSTEIN

[Update 2003: The term "polyamory" was coined in 1990 by neopagan leader Morning Glory Zell (1990) to describe a lifestyle that embraces multiple, simultaneous, openly conducted, romantic relationships which generally, but not always, expressly include a sexual component. The word is a combination of Latin and Greek roots for "many loves."

[Polyamory takes many forms, the most frequently encountered variants being:

- Open Relationships—A clearly defined group (generally two) of adults who expressly agree that their relationship will be *open*, (i.e., nonexclusive) in the romantic/emotional and, generally also, sexual dimensions. These agreements are seldom entirely open-ended. Much more often, these agreements incorporate a variety of boundaries and constraints, including restrictions concerning the primacy of the original relationship, gender of the other partner(s), degree of permissible emotional involvement, permissible sexual practices/activities, and so on (O'Neill & O'Neill 1972; Francoeur & Francoeur 1974).
- Group Marriage (*aka* triad, quad, etc.)—A clearly defined group of at least three adults who expressly agree to consider each member of the group to be "married" to every other member of the group. Such relationships may be open (i.e., members may have sexual and/or romantic/emotional relationships with others outside the group) or closed (also known as *polyfidelitous*) in which no such relationships are permitted outside the group (Constantine & Constantine 1973).

- Intimate Network—A clearly defined group of adults, partnered in various configurations or nominally single, whose members expressly agree to form a network, within which friendships may include a romantic/emotional and/or sexual component. These networks may also be open or closed (Ramey 1976).

[It should be noted that polyamory represents an *approach* to intimate relationships, rather than merely a particular practice. Therefore, it is possible for an unpartnered person, or a person presently celibate, nevertheless to accurately describe him- or herself as being polyamorous in philosophy and approach to relationships.

[Further, unlike its “sibling” swinging, polyamorous relating is expressly open to the full range of romantic/emotional connection, is not couple-centered, and philosophically at least, tends to de-emphasize the sexual dimension in favor of the emotional/romantic dimension. It also differs in that polyamory generally embraces the concept of an alternative family structure, seeking to replace the extended and expanded families of the past with a new form of “intentional family,” whereas swinging centers exclusively on the sexual/friendship needs of adults.

[Though some authors (e.g., Walston 2001) trace the genesis of polyamory to the Free Love movements and communal living experiments of the 19th century, this treatment will concern itself only with its 20th-century emergence as a distinct relationship option.

[1. *Early Research—1960s and 1970s.* The relationship approach that would ultimately become identified as polyamory first emerged in the research literature as a subset of swinging or comarital sexuality, described by Symonds (1968) as “utopian swingers,” as contrasted to “recreational swingers.” The main observed difference was that utopian swingers embraced a sexually nonexclusive lifestyle as but one aspect of a larger unconventional and nonconformist worldview, whereas recreational swingers’ only area of significant deviance was their nonexclusive sexuality. (See also Denfield & Gordon (1970), Bartell (1971), Gilmartin (1974, 1978), and Jenks (1985)). Varni (1971) characterized essentially this same subgroup of swingers as “communal” in his five-part segmentation, reflecting this group’s ties to the various communal-living experiments of the 1960s, though his “interpersonal” swinger category also would describe the behavior of a significant portion of today’s polyamorists.

[Smith and Smith (1973) drew the distinction between the “recreational” and “utopian” subcultures more clearly, based on the two groups’ very different approaches to reconciling what they *prefer* versus what they will *accept*. Many contemporary polyamorists explicitly reject swinging, and the most oft-stated public reason remains that pinpointed by Smith and Smith for their “utopians” three decades ago—that they desire a total relationship, and find sexual non-exclusivity alone insufficient or unfulfilling.

[Seminal research on polyamory included studies of “group marriage” and “intimate networks.” The preeminent researchers of group marriage were Larry and Joan Constantine (1971), whose 1973 book, *Group Marriage: A Study of Contemporary Multilateral Marriage*, represented the consummation of years of research. The Constantines created the term “multilateral marriage” to describe the object of their studies. They defined a multilateral marriage as “one in which three or more people each consider themselves to have a primary relationship with at least two other individuals in the group.”

[The Constantines were virtually alone in examining the effects on children being raised by adults who practice non-traditional intimate relationships. Their 1976 work, *Trea-*

*tures of the Island: Children in Alternative Families*, reviewed and summarized their own and others’ research that demonstrated conclusively the falsity of the oft-repeated assertion that being raised in nontraditional families is invariably detrimental to children. (Decades of subsequent research on children raised in gay and lesbian households, who are subject to the same canard, have further refuted that notion. It nevertheless retains wide public acceptance.)

[The concept of intimate networks, a term first used by Farson et al. in 1969, was explored to the fullest by James W. Ramey in several papers (1972, 1975), and ultimately a book (1976). Ramey (1972) described relationship networks he called “intimate friendships,” defined as “an otherwise traditional friendship in which sexual intimacy is considered appropriate behavior.” Ramey placed intimate friendships at the approximate midpoint on a continuum of sexually nonexclusive relationship options, ranging from beginning swinging to group marriage.

[The term *SOM/R*, for Sexually Open Marriage or Sexually Open Relationship, was used by Knapp and Whitehurst in 1975, referring to their earlier independent studies of such relationships. Unlike many of their contemporaries, their research (Knapp 1974, 1975; Whitehurst 1974) focused on what today would be identified as polyamorous relationships, inasmuch as the subjects, though partnered, nevertheless engaged *individually* in independent relationships and sexuality, as contrasted to the couples *as couples* model that characterizes swinging.

[2. *Early Popular Influences.* The bestselling 1972 book, *Open Marriage*, by Nena and George O’Neill is widely credited with being a major turning point for widespread mainstream public interest in new forms of egalitarian, growth-focused marital relationships. Though the O’Neills touched on sexual nonexclusivity only as an adjunct to their main premises, the term “open marriage” has come to mean “*sexually* open marriage.” The O’Neills were not opposed to sexual openness; rather, they took a neutral stance (O’Neill & O’Neill 1972, 254). Their model of nonpossessive, mutually supportive, self-actualizing relationships nevertheless became a key prototype for polyamory.

[Popular fiction also heavily influenced the development of polyamory in the United States. The fictional works of authors Robert Rimmer (*The Harrad Experiment* (1966), *Proposition 31* (1968)) and Robert Heinlein (*Stranger in a Strange Land* (1961), *The Moon Is a Harsh Mistress* (1966), *Time Enough for Love* (1973)) introduced a variety of models of sexually nonexclusive, egalitarian, love/affection-based relationships. As is so often the case with radical commentary on entrenched social institutions, these models were safely embedded in fictional milieus so as to diminish their perceived threat to prevailing cultural norms. Anapol (1997) credits *Stranger* and *Harrad* as being responsible for polyamory “taking shape as a mass movement.”

[Other critical influences in the popular press were Roy and Roy’s (1967) *Honest Sex*, Mazur’s (1973) *The New Intimacy: Open Ended Marriage and Alternative Lifestyles*, Francoeur and Francoeur’s (1974) *Hot and Cool Sex: Cultures in Conflict*, and Ellis’ (1972) *The Civilized Couple’s Guide to Extramarital Adventure: The Book to Read Before You Begin That Affair*, among others.

[3. *The Influence of 20th-Century Communal Experiments.* The 1960s and 1970s experiments with communal-living arrangements also contributed to the culture of polyamory. Though communes varied widely in the degree of sexual nonexclusivity that was openly practiced or tacitly allowed, for many, sexual openness proved a source of contention, and in some cases, was the factor leading to the dissolution of the commune. Nevertheless, the culture of gen-

eralized nonpossessiveness, extended intimacy, and rejection of social norms that existed in most communal-living experiments fostered an environment where the *ideal* of sexual nonexclusivity, if not the *practice*, took firm root.

[Several terms in wide use in the polyamory movement today originated in the Kerista commune in San Francisco, which lasted for approximately 20 years (1971-1991). The most frequently heard of these is the term *compersion*, which is defined as the opposite of jealousy, the pleasurable feeling one gets at seeing or contemplating a loved one enjoying love or having another pleasurable experience, including a sexual one. Kerista also claims credit for the term *polyfidelity* (Furchgot 1993), which describes their version of sexually open relationships in which each person in a group (called a Best Friend Identity Cluster) was expected to be relationally nonpreferential with respect to every other opposite-sex member of the group, including sexually. The term as commonly used today no longer connotes such a rigid nonpreferentiality, but rather a relationship structure in which the participants, whatever their number, agree to be sexually intimate only with other members of the group. It no longer assumes perfect symmetrical equality of these relationships, nor does it expressly embrace a purely heterosexual norm.

[4. *Retrenchment in the Era of AIDS*. In the 1980s, the advent of the AIDS crisis allowed all nonexclusive sexuality to be portrayed as inordinately dangerous, and possibly fatal. Simultaneously, a general public swing toward political conservatism during the Reagan and G. H. W. Bush administrations reinforced social opprobrium for nontraditional intimate relationships. As a consequence, research into SOMs/SORs virtually ceased. While the gay, lesbian, bisexual, and transgendered movement was galvanized by the crisis, and consequently made grudging progress throughout the 1980s, all other forms on nontraditional relationships were effectively driven underground.

[One bright spot in an otherwise bleak research landscape is Blumstein and Schwartz' 1983 *American Couples: Money, Work, Sex*. This exhaustive analysis of data provided by over 6,000 couples—heterosexual, gay, and lesbian—while not statistically representative of the entire U.S. population, nevertheless provided valuable insights into the attitudes of key demographic groups within society. One significant finding was that among their sample population, 15% of married couples, 28% of heterosexual cohabiting couples, 29% of lesbian couples, and 65% of gay male couples had explicit agreements for SOMs/SORs (Blumstein & Schwartz 1983, 585). Unfortunately, their data do not describe the exact nature of the SOM/SOR agreements; these, therefore, could encompass polyamory, swinging, or other variants of SOM/SOR behavior.

[5. *The 1990s' Renaissance*. Polyamory, now with its own distinct name, reemerged in the 1990s, fueled by the ever-increasing reach of the Internet/World Wide Web and by the generally more liberal social climate that accompanied the Clinton administration. It had clearly detached itself from the swinging movement, developing its own set of norms which focused on individual growth, strict equality between the genders, high investment in communications, openness to all sexual orientations, and a broad acceptance of a variety of relationship configurations.

[The emergent polyamory community was heavily influenced by several divergent communities from whose ranks many of its practitioners were drawn. Chief among these were the more sexually liberal elements of the neopagan movement, such as the Zells; the science-fiction fandom community, who were in the process of rediscovering Heinlein and a number of other science fiction/fantasy au-

thors who were incorporating polyamorous themes into their fiction, such as Marion Zimmer Bradley, Marge Piercy, Ursula K. LeGuin, S. M. Stirling, and Laurell K. Hamilton; and significant segments of the bisexual movement, which, while struggling for acceptance within both the homosexual and heterosexual communities, also sought to find a philosophical "home" where they would be more easily accepted and where any nonsexually exclusive practices would be treated with respect. Many of the early leaders in what would become the polyamory movement were also influenced by, or led, efforts to reintegrate sexuality with both traditional and nontraditional forms of spirituality, exemplified by the creation of The Body Sacred in 1993 (organized by Deborah Anapol, the Rev. Jerry Jud, Rustum Roy, and others) and various earlier "sex and spirit" retreat experiences.

[Two leaders of the contemporary polyamory movement emerged in the early 1990s: Deborah Anapol and Ryam Nearing. The two collaborated briefly in the mid-1990s, but shortly separated to pursue their different visions of the polyamorous ideal. Nearing actually began her "public" advocacy in the mid 1980s, with the 1984 publication of her book, *The Polyfidelity Primer*. Nearing freely accepts, but generally does not emphasize, SOMs/SORs, favoring the polyfidelitous model. She also emphasizes the familial aspects of the polyamorous relationship, including enhanced parenting. Anapol's *Polyamory: Love Without Limits*, originally published in 1992, and a new edition was released in 1997. Anapol's vision ultimately led her more in the direction of the "sacred sexuality" movement. Both appear to incorporate polyamory into a wider worldview that emphasizes environmental stewardship, interpersonal connectedness, non-creedal spirituality, antimaterialism, and a strong sense of intentional-community building.

[One possibly unanticipated consequence of the two most visible leaders of the contemporary polyamory movement placing polyamory in this context was to further entrench in the minds of some contemporary observers (e.g., Gould 2000) the 1970s' image of polyamory as a marginal, idealistic, "counterculture" phenomenon. This effect was amplified by the counterculture rhetoric and "progressive" political leanings frequently displayed by many authors of popular treatments of polyamory throughout the 1990s (e.g., West 1996; Easton & Liszt 1997; Munson & Stelboum 1999).

[One exception was Perper, Cornog, and Francoeur's *Sex, Love and Marriage in the 21st Century* (1999). The vignettes in this book, which focused on clergy and laypersons' approaches to nonmonogamy, demonstrated that polyamory could and did represent a considered response by a growing number of more-mainstream, nonradical adults to the increasingly painful dysfunctions and limitations of contemporary monogamous marriage, and that a polyamorous SOM/SOR could be compatible with a variety of different philosophies, spiritual paths, and worldviews.

[Throughout the 1990s, the polyamory movement gained momentum and visibility. By the close of the decade, such mainstream publications as *Time* magazine were beginning to treat polyamory somewhat evenhandedly (Cloud 1999).

[6. *The New Millennium*. The turn of the century saw mainstream U.S. media, such as *Elle* magazine, the *Montel Williams Show*, and the *John Walsh Show* offering treatments of polyamory that eschewed the sensationalist approach that characterized most previous media coverage. In 2002, the *Oxford English Dictionary* decided to include *polyamory*, though the definition adopted focuses only on the consensual nonexclusive-sexuality aspect of the practice, unfortunately further blurring the boundaries between polyamory and traditional swinging in the public mind.

[The Web-inspired grassroots nature of the polyamory movement in the United States cannot be overemphasized. An online search in February 2003 of the popular Yahoo Groups online email lists revealed no fewer than 323 groups with a purported connection to polyamory. One website accessed at the same time listed contact information for 92 local and/or regional polyamory support or social groups in the United States.

[7. *Conclusion.* As it developed, polyamory grew farther and farther from its supposed point of origin in the couple-centered swinging milieu. In hindsight, it has become obvious that polyamory was always a parallel development, an equal sibling of swinging, not a descendent or variant. Both movements were born of the radical gender realignment occasioned by World War II, delayed briefly by the socially conservative retrenchment of the 1950s, and emerged as distinct entities in the 1960s and 1970s, midwived by the advent of readily accessible birth control, changing public attitudes about premarital sexuality, and a growing awareness of women's rights in general and, specifically, their right to enjoy the same sexual freedoms as men had accessed for millennia.

[While many who practice polyamory do adhere to Symonds' and Varni's stereotype regarding its incorporation into a particular (utopian) worldview, strong anecdotal evidence suggests that there exists today a wide diversity of backgrounds, attitudes, and beliefs among polyamorists. Research into the true demographics and sociographics of polyamorists suffers from the same challenges facing research into other practices widely viewed as "deviant"—most practitioners are invisible, safely "closeted," and only the more extreme practitioners or those with "less to lose" are readily available for study.

[As polyamory continues to emerge as a discrete relationship form, more research will be needed to develop a clearer picture of its actual incidence and frequency, the variations in form, and the demographic and sociographic characteristics of its practitioners. (*End of update by J. R. Fleckenstein*)]

### *Sexuality and People with Physical and*

*Developmental Disabilities* MITCHELL S. TEPPER  
*Government Policies Affecting Sexuality and Disability.* Over the past 20 years, pivotal legislation has been enacted in the United States that enables people with disabilities to gain their rightful place as equal members of American society. These changes have been led by spirited people with disabilities and their advocates. The Rehabilitation Act of 1973, the 1975 Education for All Handicapped Children Act (Public Law 94-142), and the Americans with Disabilities Act passed in 1990 have all added opportunities for inclusion and integration into the community for people of all abilities. With inclusion and integration have come greater opportunities for social interaction and sexual expression. The same spirit that has raised disability-rights issues to a national priority is now demanding that people with disabilities be recognized as sexual beings with a right to sexual education, sexual healthcare, and sexual expression afforded under the law.

Demands for the sexual rights of people with disabilities have resulted in a resurgence of research interest in the area of sexuality and disability in the 1990s. Notably, the National Center for Medical Rehabilitation Research (NCMRR) of the National Institute of Child Health and Human Development under the National Institutes of Health has identified sexuality as a priority issue that has an impact on the quality of life of people with disabilities. It subsequently issued a Request for Applications on Reproductive Function in Peo-

ple with Physical Disabilities in February of 1992. The purpose of the request was to develop new knowledge in the areas of reproductive physiology, anatomy, and behavior that are common to people with disabilities, with the goal of restoring, improving, or enhancing reproductive function lost as a consequence of injury, disease, or congenital disorder. The request for applications included a specific objective to characterize the effect of impairments of sexual function on psychosocial adaptation, emotional state, and establishment of intimate relationships. Special focus was placed on research with women and minorities who have disabilities. NCMRR has funded six studies on sexuality and disability over the last three years. Two of the studies were with women who have spinal cord injury, and a third was a study of women with a variety of disabilities.

*Consumers with Disabilities Leading the Way.* Research, education, and advocacy efforts in the area of sexuality and disability are being led by people with disabilities (consumers). A review of the most recent annotated bibliography on sexuality and disability published by the Sexuality Information and Education Council of the United States (SIECUS 1995) reveals a growing number of books, newsletters, special issues of publications, and curricula on sexuality and disability written by people with disabilities. In addition, national consumer-based organizations, like the National Spinal Cord Injury Association, the National Multiple Sclerosis Foundation, and the Arthritis Foundation, are beginning to publish self-help brochures on the specific effects of particular disabilities on sexuality. Most recently, self-help groups have been appearing on the Internet, computer bulletin-board services, and commercial computer services like America Online.

*Healthcare Professionals Involved in Sexuality and Disability.* In addition to the work by people with disabilities and nonprofessional advocates, healthcare professionals are also taking an increased interest in sexuality and disability. The American Association of Physical Medicine and Rehabilitation has a Sexuality Task Force; the American Association of Sexuality Educators, Counselors, and Therapists has a special-interest group that focuses on educating medical and allied help professionals in the area of sexuality and disability; the Society for the Scientific Study of Sexuality includes presentations and workshops in the area of sexuality and disability for its members; and Planned Parenthood agencies around the country have increased education and services in the area of sexual healthcare to people with disabilities. More rehabilitation hospitals are including "privacy" rooms to give patients an opportunity to experiment sexually while still in the hospital, and many are adding specialty programs in the area of fertility and erectile function for men, obstetric and gynecological care for women, and parenting for both men and women with disabilities.

*Portrayals of Sexuality and Disability in the Popular Media.* The portrayal of people with disabilities as sexual beings has improved over time in the popular media. Movies that include a focus on the sexuality and relationships of people with disabilities, such as *Forest Gump*, *Passion Fish*, *Water Dance*, *Regarding Henry*, *My Left Foot*, *Children of a Lesser God*, and *Born on the Fourth of July*, have dealt with the issue of sexuality and disability with varying degrees of sensitivity, and have enjoyed success at both the box office and in video stores. TV shows have also included people with disabilities and sexuality themes. One show, *LA Law*, where one of the stars portrayed a person with a developmental disability who had a sexual relationship with an-

other person with a developmental disability, was honored by the Coalition of Sexuality and Disability for the positive portrayal of sexuality and disability in the media. There has also been an increase in TV commercials that include people with disabilities in relationships or with children. Popular magazines ranging from *Bride* to *Penthouse* and *Playboy* are also beginning to include feature articles on sexuality and disability. Efforts to portray people with disabilities as part of everyday life in the media are slowly helping to explode the myth that people with disabilities are asexual.

**Problems, Controversies, and Hurdles.** Two of the most serious sexual problems facing people with disabilities are 1. the high rate of sexual abuse, exploitation, and unwanted sexual activity, especially among women with physical disabilities and all people with developmental disabilities, and 2. the risk of STDs, including HIV, among people with cognitive impairments who are sexually active. Two leading areas of controversy are 1. the issue of what constitutes informed consent for sexual activity in people with serious cognitive impairments, and 2. the area of reproductive rights, eugenics, abortion, and prenatal testing for disabilities. As far as hurdles, there is still a need for greater access to information and educational material that affirms the sexuality of people of all abilities, including people with early- and late-onset disabilities, physical, sensory, and mental disabilities, and disabilities that hinder learning. Despite the positive current trends in sexuality and disability, we still have a long way to go in increasing the number of sexuality education and training programs for teachers, healthcare workers, and family members to help them understand and support the normal sexual development and behavior of persons with disabilities. A goal is that all social agencies and healthcare delivery systems develop policies and procedures that will insure sexual-health services and benefits are provided on an equal basis to all persons without discrimination because of disability.

#### **Sexuality and Older Persons** ROBERT T. FRANCOEUR

In 1860, over half of the American population was under 20 years of age and only 13% over age 45. In 1990, less than a third were under age 20, and 21% were over age 45. The so-called Baby Boomers born between 1945 and 1965 are now in their middle years. With the birthrate less than 15 per 1,000, America has become a graying society.

Although Americans over age 50 are the fastest-growing segment of our population, research on their lifestyles and patterns of intimacy has been almost exclusively limited to studies of the chronically ill, the socially isolated, and the poor. Edward Brecher (1984) was one of the first to study older healthy Americans. His sample of 4,246 persons between ages 40 and 92 was largely white and affluent, although he did include a low-income group. His overall conclusion was that the sexual interests and activities of older persons are the best-kept secrets in America. Although there is a common belief that the elderly are no longer interested in sexual intimacy, older persons were just as affected as young people by the social turmoil and changing attitudes of the 1960s and 1970s.

Brecher found that healthy, older person today are "enormously different from the older person of 40 or 50 years ago," and very much interested in intimacy and sexual relations. Not one of Brecher's 4,246 respondents was sexually inactive, although masturbation was the

most common sexual outlet. Forty-four percent rated their sexual satisfaction as most enjoyable; less than 1% rated their sexual activity as not enjoyable (see Table 14). Poor health was a major determinant in hindering older persons from maintaining an active sexual life.

About half of these couples reported engaging in oral-genital sex and did not limit their sexual activities to nighttime. Most of the men and women were usually orgasmic. About one in 15 had participated in group sex after age 50. One in five couples had engaged in extramarital sex; 1% of couples had a mutually accepted "open marriage." Forty percent of older single women reported a relationship with a married man. A third thought it was acceptable for an older man or woman to have a much younger lover.

In another study of healthy, upper-middle-class men and women, ages 80 to 102 living in residential retirement communities, 14% of the men and 29% of the women were still married. Sexual touching and caressing, followed by masturbation and then intercourse were the most common sexual activities. Of these outlets, only touching and caressing declined with age, a decline more evident in men than in women. Those who had been sexually active earlier in life tended to remain sexually active in their 80s and 90s, although the frequency of sexual intercourse was sometimes limited by their current physical health and by social circumstances, including the lack of an available partner (Bretschneider & McCoy 1988).

*The Starr-Weiner Report on Sex and Sexuality in the Mature Years* (1981) examined the sexual lives and attitudes of 800 persons, aged 60 to 91, from four regions of the country. When the sexual activities of these 60- to 90-year-olds were compared with the 40-year-olds Kinsey studied 35 years earlier, there was no significant decline when opportunities for sexual activity existed. "Sex remains pretty much the same unless some outside event intrudes, such as a health problem, the loss of a spouse, impotence, or boredom." A reliable predictor of the sexually active life of older persons is their acceptance or rejection of the social stereotype of the dependent, sickly older person. Older persons who maintain an active participation in life in general tend to be more sexually active in their later years.

Starr and Weiner also identified two major problems with no easy remedy. First is the tendency for older men to become asexual when they encounter an occasional erec-

Orgasms while asleep or awakening	26%	24%	17%
Women who masturbate	47%	37%	33%
Masturbation frequency for women who masturbate	0.7/week	0.6/week	0.7/week
Wives having sex with husband	88%	76%	65%
Frequency of marital sex	1.3/week	1.0/week	0.7/week
<b>Men</b>			
Orgasms while asleep or awakening	25%	21%	17%
Men who masturbate	66%	50%	43%
Masturbation frequency for men who masturbate	1.2/week	0.8/week	0.7/week
Men having sex with wife	87%	78%	59%
Frequency of marital sex	1.3/week	1.0/week	0.6/week

tion or orgasmic problem. Instead of exploring noncoital pleasuring, many older men simply give up all interest in sex. The second problem is the ever-growing number of older women who are without sexual partners and, thus, deprived, against their will, of sexual intimacy and pleasure. (See Section 6B below on sexuality among older homosexual men and women.)

### *A Closing Comment*

Throughout this section, we have noted the tendency of sexuality researchers in the U.S.A. to focus on the incidence and/or frequency of sexual behaviors in various lifestyles. There has been little corresponding research on the process of sexual relationships or the dynamics within them. This is precisely the same point we made in summarizing the section on adolescent sexuality. Suffice it to say that American researchers need to move beyond asking how many people “do it” and how often they “do it” to more fully investigate the contexts surrounding adult sexual lifestyles, and to identify the social, psychological, and biological factors associated with sexual practice.

[*Update 2003*: Compared with research on childhood and adolescent sexuality, there has been considerably less research on the sexual practices of adults. Some important studies (Smith 1991; Gagnon, Giami, Michaels, & de Colomby 2001) have been completed in recent years. Although it did not get much attention at the time, Smith (1989) did report that roughly 20% of adult Americans did not have a sexual partner in the last year. In a study comparing different sexual-orientation groups, Horowitz and his associates (2001) reported the same finding. There has been little research on this group that is not having sex. The study by Gagnon and his associates (2001) is one of the first to ever compare national surveys from two countries. Compared to stereotypes, they found that French adults tended to be more monogamous and to exhibit fewer male-female differences. Interestingly, older American women were more likely than others to report no sexual partners. (See summary by T. Perper in the chapter on France, Section 5A, *Interpersonal Heterosexual Behaviors, A French/U.S. Comparison*, in this volume).

[Research on adult populations does appear to be becoming more sophisticated. Using national data, Liu (2003) found that the quality of marital sex does decline slightly and gradually with length of marriage. Wives were less satisfied with marital sex than husbands. In a series of studies (Byers 2001; Lawrence & Byers 1995), we have seen growing evidence that marital sex is well explained by social exchange variables. Exchange variables have been linked to relationship satisfaction, sexual satisfaction, sexual communication, and sexual functioning itself for both sexes (Weis 1998). (*End of update by D. L. Weis*)]

## 6. Homoerotic, Homosexual, and Bisexual Behaviors

To this point, we have examined the general socio-historical context of sexuality in the U.S.A. and reviewed evidence concerning what may be called mainstream sexual behaviors, in the sense that a majority of Americans engage in these activities. Our review of autoerotic behaviors and the development of heterosexual patterns throughout the lifecycle may be seen in this light. We did occasionally mention less-common patterns. For example, the review of childhood sexuality did note that homosexual activities do occur in childhood, and research that examined the development of homosexual behavior was briefly discussed. However, the focus of the chapter so far has clearly been on mainstream, and essentially heterosexual, patterns.

Our review will now shift to an examination of a variety of sexual patterns that are less common, as this has also been a prime concern of sexuality professionals in the U.S.A. We hope that the reader will note that many of the general themes we have stressed so far—change and diversity, for example—are applicable to these patterns as well. In reviewing heterosexual lifestyle patterns, we stressed that researchers have tended to focus on the incidence or frequency of sexual behaviors and less likely to investigate relationship dynamics or theoretical explanations of behavior. These same trends also tend to characterize the study of less-conventional sexual behavior.

### A. Children and Adolescents

ROBERT HAWKINS and WILLIAM STACKHOUSE

Although research on childhood sexual activity in the United States is limited, what little we know (and can remember on a personal level) indicates that a great deal of same-gender sex play takes place among children, usually of an exploratory nature. Occasionally, a lesbian, gay, or bisexual adult will recall such childhood activity as being different from exploratory activity with someone of the other gender, and therefore indicative of an early awareness of orientation. But it appears that, for the majority of people, childhood sexual play, while it includes same-gender activity, has little implication for adult orientation.

Some research shows a relationship for males between cross-gender behavior as a child (known as “sissy” behavior) and homoeroticism as an adult, but that relationship has not been shown to be causal and may be more a result of the patriarchal homophobic character of the culture than any innate biological characteristic of the child. This is more apparent when one compares the research on females who engage in cross-gender-role behavior as a child (known as “tomboy” behavior), wherein the same relationship is not present. Even the labels for the person engaging in cross-gender-role behavior carry different connotations in the culture. For a boy, being called “sissy” is considerably more detrimental to healthy development than is being called “tomboy” for a girl (Green 1987).

When the American child is developing a lesbian, gay, or bisexual identity, the heterosexism and homophobia of the culture dictates that this is not an acceptable orientation, and it becomes difficult at best for the child to develop into an adolescent or adult with a positive self-image. Lesbian and gay youth, particularly those from small communities, seldom receive support from their peers or from the sex education and family life courses in their school. Books that could be supportive, such as Leslea Newman’s *Heather Has Two Mommies* (1989) or *Gloria Goes to Gay Pride* (1991), are usually banned from school curricula or simply not considered appropriate for children, even though they were written specifically for all children to read. Counselors and teachers generally assume that all of their students are heterosexually oriented, even though some students in any school will have a same-gender orientation.

As children grow into adolescents and attempt to deal constructively with the tensions and uncertainties of adolescence, gay, lesbian, and bisexual teenagers have to confront the question of the gender of the person to whom they find themselves sexually attracted. Do they surrender to peer and cultural pressure and date only members of the other gender? Do they tell a best friend of their orientation and risk losing that friend or being ostracized or physically attacked? Should they get sexually involved with someone of the other gender to attempt to prove that they really are “straight”? Just what do they do when they find themselves sexually attracted to someone of the same gender? Fortunately, the number and

quality of resources that lesbian and gay teens can use are increasing, both on national and local levels. During the late 1980s and early 1990s, many books, pamphlets, and other resources have been published, providing practical guidelines and insights into what lesbian and gay youth should know about dating, living together, and coping in a hostile world.

However, the resources that are available for them are usually available only through homophile groups and a few commercial bookstores, and are generally not available through school libraries or other youth agencies. For example, the Boy Scouts organization has been explicitly noninclusive for both homosexual youth members and adult leaders. In rare cases, such as in New York City, a special high school has been established for gay and lesbian youth who are unable to cope with the discrimination that they face in a regular school setting. This discrimination comes from other students, as well as teachers, administrators, and counselors, making it difficult for these students to obtain an education.

Although this discrimination is still rampant in elementary and secondary schools, it is lessening somewhat in colleges and universities. Most American public and large private colleges and universities recognize and fund student organizations such as a Gay and Lesbian Alliance (GALA) or a Lesbian and Gay Organization (LAGO). Several chapters of gay fraternities and lesbian sororities have been organized. However, even where such organizations exist, many lesbian and gay collegians avoid them or keep their membership quiet. Even at religiously based institutions of higher education, there are differences with respect to the acceptance of these organizations. As late as 1995, one university, the Roman Catholic-affiliated Notre Dame, refused to allow any homophile organizations, and even denied the availability of counseling-center-sponsored group-support activities for lesbians, gays, and bisexuals. At the same time, a large Jewish orthodox-affiliated university, Yeshiva, provides numerous opportunities and funding for gay and lesbian organizations at both the graduate and undergraduate levels.

Even though information on issues confronting lesbian, gay, and bisexual adolescents may be available in printed form, the difficulty in gaining access to such materials, the anti-homoeroticism that is rampant in the media, the negative stereotypes that are still being touted as representative of all who are homoerotic, and the silence on ambieroticism or bisexuality all combine to make life unnecessarily difficult for the adolescent lesbian, gay, or bisexual person in this country. One result is that almost one third of adolescent suicides are related to the issue of homoeroticism. The data on attempted suicide among adolescents are also informative. About 10% of heterosexual male and female adolescents attempt suicide, while twice as many lesbian adolescents and three to four times as many gay adolescents attempt suicide (Youth Suicide National Center Report 1989). The lack of support and acceptance of these young people is undoubtedly a factor in this difference.

## B. Adults

ROBERT HAWKINS and WILLIAM STACKHOUSE  
*Research on Gender Orientation*

The question of gender orientation and the definition of orientation is complex and confusing for both sexuality researchers and the layperson alike. Several researchers have concluded, after extensive study, that there is no clinical description that can be applied to the label "homosexual"—that there is virtually no single phenomenon that can be labeled "homosexuality" and then described in clinical terms. Yet, some theorists have suggested models to define and categorize. When researchers then indicate that they are using a specific model, usually there is no internal consistency.

Take, for example, the Kinsey continuum of orientation. After interviewing 5,300 men and 5,940 women in the 1940s, Kinsey and associates developed a continuous scale based on the ratio of sexual fantasies and physical contacts with one's own gender and with the other gender. Along this continuum are seven points, labeled from 0 to 6, with a "Kinsey 0" being a person whose behavior and fantasies have always involved persons of the other gender, and a "Kinsey 6" being a person whose behavior and fantasies have always involved persons of their own gender.

Even where researchers have indicated their use of the Kinsey scale, the actual definitions of research subjects have varied significantly from the original and also varied from study to study. In some instances, fantasy data are not available and consequently not considered; in other instances, behavior alone is the criteria for being placed in a "Kinsey" category, with no recognition of the difference in subjective experience of the sexual activity. In other studies, subjects are placed on the continuum solely according to the gender of the partner with whom they are living.

There are other models available that begin to reflect some of the complexities of gender orientation. Moses and Hawkins (1982, 1986) indicated that the minimum data necessary for identifying orientation in subjects were an assessment of the gender of emotional relationship partners, the gender of sexual attraction partners, and the gender of partners in sexual fantasy content, and that all three of these should be considered from a past and a present perspective, implying that, although orientation may be consistent throughout one's life, it is not necessarily so. It is seen as a potentially dynamic characteristic.

An even more complex model was developed by Fred Klein, a physician and gender-orientation researcher. Klein indicated that an assessment of orientation needed to consider seven criteria over three time periods, resulting in a Sexual Orientations Grid of 21 cells. The criteria are: 1. sexual attraction; 2. sexual behavior; 3. sexual fantasies; 4. emotional/affectional relationship preference; 5. social relationship preference; 6. lifestyle; and 7. self-identification, with each of these criteria being assessed over three time periods: the past, the present, and the future ideal. This was the first model to present the notion that one's self-label might be an important facet of one's orientation, and the time factor was an acknowledgment of the potentially dynamic character of orientation. Research subjects can rate themselves on these criteria using a three-by-seven grid and the Kinsey ratings, summing the ratings, and then dividing by 21 to produce a position on a scale identified popularly as "The Kinsey Scale" (Klein 1978; Klein, Sepekoff, & Wolf 1985). Although the initial response to Klein's model was that it was more comprehensive and realistic, its complexities have kept most researchers from using or disseminating it widely. It has thus remained unfamiliar to many.

## *Developmental Biological Insights*

Several studies in the past decade have attempted to identify biological determinants for adult homoeroticism from a heterosexist theoretical base, in which heterosexual behavior is viewed as the basic, natural human behavior, and anything else is deviant. There is usually little recognition of definitional complexity or the possibility of precursors rather than determinants. Subjects are typically placed in the dichotomous classification so prevalent in the culture—that one is either gay or straight, homosexual or heterosexual—with no recognition of the Kinsey continuum, and especially no recognition of Klein's model. Researchers have purported to examine twins, siblings, adopted children, and brains of people who are homosexual and those who are not.

For example, Simon LeVay (1991) reported finding a portion of the hypothalamus that was smaller in homosexual men than in heterosexual men and was equal in size to that portion in heterosexual women. There were no lesbian brains identified as such in this study. The “finding” was quickly seized by the popular media and soon became what is called “common knowledge.” There were many problems with the study, but these were generally ignored, even in the scientific press. The definitional problem, whereby subjects were classified according to whether they were known to be gay or not (obviously all subjects were no longer living, so no information could be garnered from the subjects), has been ignored. The size of the sample (19 men previously identified as gay, 16 men identified as not known to be gay and, therefore, heterosexual; one man known to be identified as bisexual and included in the study as such; and six women, all classified as heterosexual) has also generally been ignored. The fact that the size of another part of the hypothalamus in the women’s brains did not coincide with other research on women’s brains was ignored in discussions, and the possibility that what was found may have had something to do with body build and general physical characteristics rather than directly with sexual orientation was also never discussed. The overly simplistic design was convenient, because including even a few of the other variables, such as body build or sexual history, would mean that the sample size would have to be considerably larger to enable any conclusions to be drawn.

Dean Hamer and his research team (1993) have reported the discovery of a genetic region, the Xq28 region on the X chromosome, that is claimed to be associated with male homosexuality in about three quarters of gay men and inherited on the maternal side of the family. Similar research on lesbian women does not show similar findings. There is also no attempt in all of this research to explain the “exceptions” that are reported. If there is a “gay” gene, then why is it that all men who are gay do not show it? Most biologically focused studies suffer from similar problems, first with the issue of definition, then with the exclusion or nonsimilarity of research on women who are attracted to women, and finally with assumptions, conclusions, and discussions of results that assume the “natural” state of the human being is exclusively heterosexual.

Although the question of a biological basis for homoeroticism has, in recent years, seen increased interest and attention, such research consistently does not consider the complexities of orientation, such as emotional attraction, behavior, and other criteria that constitute sexual orientation in Klein’s model. Most of the classification methods for identifying orientation of subjects in these studies are overly simplified. Although there may be biological precursors to orientation, no well-designed, appropriately controlled study has been done to support that conclusion.

One positive side effect of the popular interpretation of research into possible biological roots of homoerotic orientation has been in easing the acceptance of gay and lesbian persons by some churches. One can paraphrase a common response among some mainstream Protestant church people and leaders: “If homosexual orientations are not a freely chosen preference but in some way rooted in prenatal genetic, hormonal, and/or neural templates, then God and nature made them this way, and we and the church must accept that reality.”

### *Bisexuality Research*

The research on bisexuality or ambieroticism is even more scant. It is very difficult to do research on bisexuality if one cannot define it, and there is no simple, dichotomous cultural model as is available with research on homosexu-

ality. In a 1994 book, *Dual Attraction*, Weinberg, Williams, and Pryor report that using the Kinsey scale with sexual behaviors, sexual feeling, and romantic feelings, they identified five different types of bisexuals in their study of 435 men and 338 women:

1. The Pure Type, scoring at least 3 on all criteria;
2. The Mid Type, scoring 3 on one criteria and 2 to 4 on the other two;
3. The Heterosexual-Leaning Type, scoring 0-2 on each of the three criteria;
4. The Homosexual-Leaning Type, scoring 4 to 6 on each dimension; and
5. The Varied Type, whose scores did not fit any of the first four categories or types.

Additionally, it is only in the recent past that models for development of a bisexual identity have been proposed, and further research into ambieroticism, such as was begun by Fred Klein, has moved very slowly. The heterosexist nature of the culture, combined with the indigenous psychological and sociological perspectives of many researchers, has precluded the acceptance of a somewhat radical notion that the basic state of the human sexual orientation is ambierotic and mutable, with exclusive heterosexual or exclusive homosexual behavior being equally deviant from the biological norm. Further research on bisexuality appears to be moving in that direction. (See Section C below for more on bisexuality.)

### *Incidence*

In much of the public discussion of homoeroticism, there is a preoccupation with the general question, “How many are there?” The answer to this question carries political and economic implications, and there is a need to understand the extent of the economic power and political power that this group wields. For example, is the culture required, in policy decisions, to provide for this group, or is it such a small number that policymakers are not required to respond to identified needs of this population? Commerce is in a strategic position to profit from this population, and economically driven decisions in the marketplace are taking these numbers into serious account. For example, in 1994, advertisements focusing directly on lesbian women and gay men as consumers were introduced in popular television and print media, and more mainstream commercial advertisements were being placed in homoerotically focused magazines, such as *The Advocate*, and in programs for fundraising benefits for homoerotic communities.

Another area where numbers are considered in policy decisions is the increasing recognition and development of domestic-partner benefits, such as health insurance and death benefits. This began in the early 1990s when some employers became aware that lesbians, gay men, and bisexuals comprise enough of the workforce to have an effect on productivity and efficiency, and that accommodating their needs is beneficial to the company so that it can have and keep well-qualified people.

Ignoring the basic fact that there is no definition of what “a homosexual” or “a bisexual” person is, until the mid-1990s, the most-often-cited figure for incidence of homosexuality came from the research of Kinsey and associates carried out in the 1940s. These data have been used to estimate the number of homoerotic people in the population without any indication of the simplistic nature of the definition. The commonly cited figure that 10% of American men are homosexual is a combination of Kinsey’s finding that 4% of his sample were exclusively homosexual (Kinsey 6) and 6% were predominantly homosexual (Kinsey 5) (Kinsey et al. 1948). His data on homosexual activity in women indi-

cated approximately 9% were either exclusively or predominantly homosexual (Kinsey 5 or 6) (Kinsey et al. 1953).

Laumann et al. (1994) found that almost 3% of their subjects were homosexual. Although these two sets of figures may, at first, seem at odds, the 1994 figure had a 1% error rate, and the Kinsey figure for exclusive homosexuality was 4%, so the two major studies do not differ greatly. There were some other problems with the 1994 study, such as the use of females as interviewers and the tendency of males in this culture to deny homosexual activity, even in anonymous questionnaires, but especially in face-to-face contact with anyone else; however, even with those design problems, the numbers are similar (Schmalz 1993).

### Clinical View

In 1973, the American Psychiatric Association removed homosexuality from the *Diagnostic and Statistical Manual of Mental Disorders*. This was a major turning point, both in the United States and worldwide, in the clinical acceptance of homosexuality. Homosexuality was no longer to be viewed as an illness. The impact within psychology and psychiatry was profound and has influenced many aspects of society. The basis for this change was the scientific conclusion that, among individuals who were not in clinical treatment, it was impossible to distinguish heterosexual and homosexual persons. Evelyn Hooker first arrived at this conclusion in 1957 with the first controlled study to include a comparison on a nonclinical sample of heterosexual and homosexual men.

Since then, research designs employing the principle that such nonclinical participants exist have resulted in many studies confirming that, in itself, homosexuality is not an illness. The illness model of homosexuality that had existed as the basis for so much discrimination is no longer supported by the psychiatric and psychological establishments. In 1973, the *Comprehensive Textbook of Psychiatry* was revised to state: "many homosexuals, both male and female, function responsibly and honorably, often in positions of high trust, and live emotionally stable, mature, and well adjusted lives, psychodynamically indistinguishable from well-adjusted heterosexuals, except for their alternative sexual preferences."

This has led clinicians to change their point of reference regarding homosexuals, from a pathological frame to a counseling frame, from looking at persons as sick to looking at how persons may maximize their human potential in society. Since then, many studies and books have examined aspects of the development of gay men and lesbian women, looking at identity development (social, sexual, and psychological), family issues, relationship issues, work and career development, and other dimensions of identity and lifestyle. There now exists a large body of American literature, in both the professional and general press aimed at maximizing the health and wholeness of gay men and lesbians.

Still, gay and lesbian individuals often have difficulty with their own self-acceptance and the process of deciding just how to live as gay or lesbian persons. Mental-health professionals who specialize in working with gay and lesbian clients offer individual and group counseling throughout the U.S.A. Various organizations also routinely offer support groups for a wide range of concerns. In addition, counseling is now available to the family members and friends of gay and lesbian persons who have difficulty in accepting the homosexuality of their loved ones.

### Legal Issues

In examining the legal status of lesbians, gays, and bisexuals, one needs a rudimentary understanding of the legal

system in the United States. There are levels of jurisdiction throughout the country; each jurisdiction, from local villages, to city, county, state, and the federal governments, has its own legal codes. In addition, the military has its own legal code. The issue of rights for lesbians and gays has been raised at all levels of jurisdiction. Supposedly, all of these laws are subject to the provisions of the Constitution of the United States, which provides consistency. Each state has its own state constitution, which is also to be consistent with the federal Constitution, as are the governing documents of cities and local communities.

Generally, lesbian women and gay men have no protection against discrimination based on orientation or the perception of orientation, and in 1995, only nine states had laws including sexual orientation as a minority protected from discrimination. Historically, attempts to obtain protection have followed the patterns of other oppressed groups in the United States. First, there were attempts to gain protection against discrimination in public accommodations and employment. More recently, this has expanded to include equal treatment with regard to employment-related benefits accorded to married heterosexual relationships. Examples include the benefits accrued to persons by their legally married status (as of 1995 same-gender partners are not allowed to marry legally in any state in the U.S.), as well as benefits in relation to parental status (such as adoption or custody issues), and bereavement leave with respect to family members.

Opposition to these attempts to expand discrimination protection either takes the stance that homosexual activity is immoral and, therefore, not deserving of consideration for equal protection, or suggests that lesbian women and gay men are seeking "special treatment." There is even an argument put forth that suggests that lesbian women and gay men are not an oppressed minority and should not be treated as such. Where legal protections have been instituted, it has usually been based on the need for equal treatment.

In the past decade, some local jurisdictions have passed laws recognizing the civil rights of same-gender couple relationships and of homoerotic individuals. Similarly, many corporations, of all sizes, have granted gay and lesbian couples the same benefits as heterosexual couples. For example, in Dallas, Texas, a major corporation threatened not to locate a new corporate facility in that city if the corporation's policy on domestic-partnership benefits for same-gendered couples was declared illegal by virtue of the city's discriminatory laws. The economic impact of this decision caused the city government to rescind the law.

In May 1993, a court case highlighted a conflict between the antidiscrimination clause in the Constitution of the State of Hawaii and that state's ban on the recognition of same-gender unions. The state's Supreme Court asked the state to prove its "compelling interest" for continuing the discrimination or to end it. Lawyers generally admit that it will be very difficult to prove a "compelling interest," and if it cannot be done, the state will be forced to grant legal recognition of same-gender partnerships. Currently, all 50 states grant reciprocal recognition of the legality of heterosexual marriage, but if Hawaii legalizes homosexual marriages, the other 49 states will have to decide whether to continue that reciprocity. In early 1995, several states sought to pass legislation that would limit their reciprocity to heterosexual marriage in the event that Hawaii recognized same-gender marriages (Rotello 1996; Eskridge 1996; Sullivan 1996).

Lesbians and gays are also treated differently with respect to serving in the United States armed forces. For many years, they were specifically excluded in official policy, yet were differentially managed in individual cases. For exam-

ple, when the war in Kuwait broke out, some lesbians and gays who were scheduled for separation from the service were required to serve until the end of the conflict. In another instance, an enlisted man, Perry Watkins, repeatedly told the military that he was gay, but they kept reenlisting him until someone finally decided that he should be separated from the service, and the legal process to do so was instituted (Shilts 1993).

In 1994, the military instituted a policy called "Don't ask, don't tell," in which recruits were no longer to be asked if they had "homosexual tendencies," but were also forbidden from telling anyone if they were homoerotic. Prior to this, the official policy being enforced was one in which activity was not a requirement for dismissal; simply acknowledging one's homoerotic orientation was enough to cause separation from the service. For example, Joseph Stephan, a midshipman at the United States Naval Academy, was only three months from graduation when he was asked if he was a homosexual. He indicated that he was, but never was asked, nor did he ever acknowledge any homosexual activity. He was separated from the navy and was denied his bachelor's degree from the Naval Academy (Rotello 1996; Eskridge 1996; Shilts 1993; Sullivan 1996).

Lesbians and gays have to pay special attention to wills, as biological families have successfully contested wills that left nothing to the blood relatives and everything to the person's life partner. This situation has led to the development of agencies and books focusing specifically on estate planning for lesbian and gay couples and individuals.

The legal issues for bisexuals generally focus on that part of their lives that includes someone of the same gender, so it is the homoerotic aspect of their ambieroticism that suffers from the lack of legal protection. Additionally, there is no legal option for triangular relationships that provides legitimacy, so if a bisexual person has a primary relationship simultaneously with a man and a woman, that relationship cannot be legitimized as a marriage.

### [The End of Anti-Sodomy Laws

ROBERT T. FRANCOEUR

[Update 2003: On July 25, 2003, after months of public media debate, the U.S. Supreme Court struck down a Texas law banning sexual relationships between gay men, ruling in *Lawrence v. Texas 02-102* that the law was an unconstitutional violation of their privacy. The 6-3 ruling of the Court reversed its 1986 ruling on *Bowers v. Hardwick* that supported state laws punishing homosexuals for engaging in what such laws historically called "deviant or unnatural sex." Laws forbidding homosexual sex, once universal, now are rare. Those on the books are rarely enforced, but underpin other kinds of discrimination.

[Justice Kennedy, writing the majority statement, argued that the two Texas plaintiffs "are entitled to respect for their private lives. The state cannot demean their existence or control their destiny by making their private sexual conduct a crime." Speaking for the minority, Justice Scalia took the unusual step of reading his dissent from the bench, concluding that "The court has largely signed on to the so-called homosexual agenda." Adding that he has "nothing against homosexuals," Scalia warned that "The court has taken sides in the culture war" that will lead to approval of gay marriages.

[This case began in 1998, when a neighbor with a grudge faked a distress call to police, telling them that a man was "going crazy" in the apartment next to his. Police went to the apartment, pushed open the door and found the two men having anal sex. After their conviction on a misdemeanor charge of committing an unnatural sex act, the plaintiffs were each fined \$200 and spent a night in jail.

[Forty years ago, all 50 states had an anti-sodomy law. In 37 states, the statutes have been repealed by lawmakers or blocked by state courts. Of the 13 remaining states, four—Texas, Kansas, Oklahoma, and Missouri—prohibit oral and anal sex between same-sex couples. The other nine states ban consensual sodomy for everyone, homosexual or heterosexual, married or not: Alabama, Florida, Idaho, Louisiana, Mississippi, North Carolina, South Carolina, Utah, and Virginia. All these laws apparently are invalidated by this Supreme Court ruling.

[The Supreme Court was widely criticized 17 years ago when it upheld a similar anti-sodomy law in Georgia. A long list of legal and medical groups joined gay rights and human rights supporters in backing the Texas men. Many friend-of-the-court briefs argued that times have changed since 1986, and that the court should catch up. Conservative politicians and church leaders were enraged by the Court's decision. Pat Robertson, a former presidential candidate, announced a prayer crusade for the demise of three conservative justices who contributed to the majority of six.

[Texas defended its sodomy law as in keeping with the state's interest in protecting marriage and childrearing. Homosexual sodomy, the state argued in legal papers "has nothing to do with marriage or conception or parenthood and it is not on a par with these sacred choices." Texas lawyers urged the Court to draw a constitutional line "at the threshold of the marital bedroom" (Associated Press June 26, 2003). (End of update by R. T. Francoeur)]

### Religious Issues

With the removal of homosexuality from the category of mental illness in 1973, the major foundation for legal discrimination against homosexuality was removed. As a result, religious intolerance of homosexuality, which had always been present, took on a more significant role in the debate on homosexuality within American social and political dialogue. Those who believe homosexuality to be immoral on religious grounds have since become more vocal in their quest to have their particular moral positions on homosexuality and other religious and moral issues inserted into the nation's laws (see also Section 2 on religious factors).

At the same time as Americans witnessed the radical change in the clinical view of homosexuality and the emergence of the gay-liberation movement, religious bodies in the U.S. were challenged on their stances with regard to homosexuality. Within Christian and Jewish sects, the debate generally has centered on the interpretation of sacred Biblical texts (Boswell 1980; Countryman 1988; Curran 1993; Francoeur in Gramick & Furey 1988; Gold 1992; Kosnick et al. 1977; Helminiak 1994; McNeill 1976; Presbyterian Church 1991; Thayer et al. 1987). The central locus of the debate is concerned with certain Old Testament texts, particularly the story of Sodom and Gomorrah, and the New Testament comments of the Apostle Paul in 1 Corinthians 6: 9 and 1 Timothy 1:9-10 (Helminiak 1994), which appear to condemn homosexuality. In actuality, the debate is waged on the basis of how ancient texts are interpreted and used for modern guidance. Many "fundamentalist" and traditional sects accept the ancient texts for their literal meaning and condemn all homosexual expression (Presbyterian Church, Part 2 1991). These sects, however, generally do not address the extent to which they completely ignore many other Biblical texts and do not use them for modern guidance. Other, liberal, bodies interpret the ancient texts in their historical context in the light of current biological and psychological knowledge about the origins and nature of homosexual and other orientations. These bodies, particularly liberal reformed—and to some extent conservative—Judaism, the

Episcopal Church, and the United Church of Christ, frequently welcome homosexual men and women to membership, and even to the ministry (Heyward 1989; Presbyterian Church 1991; Thayer 1987). Within the Catholic Church in America, there is a quite-visible split that, on the grassroots level, constitutes a silent schism on the issue of homosexuality. On the pastoral level, many, perhaps a majority of the clergy, accept the tolerant and liberal position expressed by the Catholic Theological Society of America (Kosnick et al. 1977), and quietly ignore the dogmatic condemnation of homosexuality by the Vatican (Curran 1993; Francoeur in Gramick & Furey 1988; McNeill 1976).

Among American religious bodies, the major continuing issues regarding homosexuality center on welcome, support, and affirmation of members within congregations and on the presence of openly gay and lesbian persons in religious leadership. Recently, support for gay and lesbian members has often led to performing "holy unions" for gay and lesbian partners. Given that the legal option of marriage has not been available, religious bodies have been the logical place for couples to seek such recognition and support. Many congregations have offered these services to both their members and to gay and lesbian persons in their communities. Although there are gays and lesbians in leadership in some religious bodies, they are few, and often do not receive the support of predominantly heterosexual congregations. The one religious place where gay and lesbian persons have found a guaranteed welcome has been in the special ministries that exist for gay and lesbian persons. This includes a variety of individual denominations and individual congregations with a special outreach to gay and lesbian persons.

### *Social Issues*

The growing visibility of homosexuals in American society and the scrutiny of the press probing the private lives of public figures have led some politicians to acknowledge publicly their homoerotic orientation. In 1980, Robert E. Bauman, a leading conservative Republican Congressman from Maryland, lost his bid for reelection after revealing his homoerotic orientation. About the same time, Congressman Gerry E. Studds from Massachusetts revealed his homoeroticism and he served in the House of Representatives until 1996. Elaine Noble was the first openly lesbian legislator in the state of Massachusetts. On the federal level, Representative Barney Frank, also from Massachusetts, disclosed his homoerotic orientation in 1987, and also continues to serve. In 1994, President Bill Clinton named Roberta Achtenberg as his highest-ranking lesbian appointee, and she was confirmed by the Congress as assistant secretary for fair housing and equal opportunity in the Department of Housing and Urban Development. In 1995, she announced that she was leaving that post to run for mayor of San Francisco.

Thanks to the political and educational activism of a wide variety of gay and lesbian individuals and groups, American society is becoming increasingly sensitized to the prevailing discrimination of heterosexism and homophobia. On the negative side, there has been an apparent increase in violence against people perceived to be homosexual. Studies have indicated increases in the reporting of violent crimes that are based on the perceived homosexuality of the victim, and students have reported witnessing harassment of students and teachers thought to be homosexual. In some instances, the growing hostility is purported to be linked with fear and anxiety about AIDS, but lesbian and gay leaders suggest that this is simply a convenient new excuse to further hate and discrimination. Lesbians, gays, and bisexuals see themselves as the last large minority that is not legally protected from discrimination, and thus, as a group, they fulfill

the need of some people to find scapegoats for whatever social ills occur. The other negative aspect of this increased visibility is that it causes the opposition to become aggressive. Observing the progress made by lesbians and gays in attempting to obtain equal rights, those opposed have taken a proactive approach in attempting to limit the rights and opportunities for lesbians and gays to enjoy a full and unrestricted life. This has taken many forms, including the development and dissemination of a video filled with partial truths and false information designed to arouse fear of and hatred toward homoerotic individuals and groups. There have also been referendums on ballots to deny homosexuals equal protection. While some of these have been passed in several jurisdictions, some of them have subsequently been declared unconstitutional by state and federal courts. That has not deterred others from developing similar referendums. In September 1996, Congress voted to deny Federal benefits to married people of the same sex and to permit states to ignore such marriages sanctioned in other states. A separate bill that would have banned for the first time discrimination against homosexuals in the workplace was defeated by a single vote.

On the positive side, openly gay or lesbian people have been elected to almost every level of government, with the exception of the executive branch of the state and federal governments (governors and the president and vice president). Voters in several jurisdictions have enacted legislation to protect the civil rights of lesbians and gays. The amount of literature and published research on lesbian and gay issues has increased exponentially in recent years, and the arts have moved to include lesbian, gay, and bisexual subjects in other than classically stereotypical and tragic roles. Research and commentary regarding gay, lesbian, and bisexual issues in the academic disciplines has become acceptable, and the result has been a concomitant exponential increase in published works in all the academic disciplines. There are even a few departments in universities specifically devoted to studies of lesbian, gay, and bisexual issues. In all the arts and literature, there are more and more instances of openly lesbian and gay themes, stories, and characters. And there are more openly gay, lesbian, and bisexual people in professional and amateur sports (such as Martina Navratilova in tennis, and Greg Louganis, the Olympic multiple-gold-medal diver), and in commerce (billionaire David Geffan).

Some people who are known privately but widely to be lesbian or gay are challenged by the gay and lesbian communities to be open. On occasion, they are "outed," that is, they are publicly announced to be lesbian or gay. Whether this is appropriate and ethical, given the extent of the homophobia in the culture, is a question. Originally, this practice was instituted only in cases where a person was widely known to be homoerotic and was not only keeping that information secret, but also was engaging in antihomosexual activity, such as gay public officials supporting antigay, antilesbian legislation. It later developed into a more-general application of "outing," which many have questioned and challenged.

One of the major problems for lesbian, gay, and bisexual adolescents is the lack of positive role models available in the homophobic, heterosexist culture. This lack contributes to the lowered self-esteem of lesbian and gay youth. The increased visibility of lesbian women and gay men throughout all levels of the society means that younger lesbians and gays are able to see others of identical orientation who have succeeded in whatever their chosen career. This has a positive effect on ego and the development of self-image.

### *Family Issues*

Gay and lesbian people have been at the forefront of defining operative, nontraditional, nonbiological family con-

cepts. Although this may have grown from the difficulties of association with biological families and the impracticality of the “heterosexual husband-wife with children” relationship model, it has resulted in the active development and maintenance of alternative family structures of great depth and commitment that have subsequently provided an alternative model for the heterosexual society. This includes not only nonmarital couples and their children, but also committed longstanding friendship circles that constitute a chosen extended family, a set of associations often with stronger bonds than those that may exist through the unchosen avenue of blood relatives.

The depth and extent of these intentional relationships have become dramatically evident in the caring provided to those within such networks in the HIV/AIDS epidemic. The depth and extent of this caring has provided incontrovertible evidence of the wholesomeness and loving nature of these associations, and has significantly challenged the remainder of society.

The social, familial, and internalized heterosexist homophobia sometimes creates a situation in which the lesbian or gay man sees heterosexual marriage as the only public option for life. They may or may not include secret homosexual activity while married. With the increased visibility of lesbians, gays, and bisexuals, this pattern of behavior is less likely to occur without conscious awareness and dissonance on the part of both marital partners. Sometimes, but rarely, the only way a gay man or lesbian can cope successfully with the social pressures is to find a homoerotic person of the other gender to agree to a “marriage of convenience,” in which they might live as roommates and have separate sexual lives.

Some lesbians and gay men choose to have children. Women have the option of childbearing through the medically established procedure of donor insemination available in this country, or they can, and sometimes do, seek and find a man who will biologically impregnate them. Men obviously do not have this option. Therefore, the issues for lesbians who want a child are different from those for a gay man who wants one. In keeping with the resourcefulness and creativity of many lesbians and gay men, there are many patterns that have been developed to achieve biological parenthood.

Support organizations for the heterosexual relatives of homoerotic individuals have formed and become available. Most notable is the organization Parents and Friends of Lesbians and Gays (PFLAG), with headquarters in Washington, D.C., and groups throughout the United States. Where there are lesbian and gay community centers, usually one finds programs for children of lesbian and gay parents, such as the Center Kids, a program at the Lesbian and Gay Community Center in New York City. These centers also usually have support groups and education sessions for the biological families of lesbians and gays, as well as for the chosen families.

### Health Issues

American lesbian women and gay men have many of the same health issues as their heteroerotic counterparts, but there are some issues that are unique, including the fact that the assumption of heterosexuality for individuals in the culture in general continues into the sphere of the healthcare consumer. When the healthcare professional is taking a history and asks, “Are you married or single or divorced?” there is little room for the lesbian or gay individual to indicate that she or he is in a long-term relationship with another person. And if the person is bisexually active, the answer to that question could be very misleading to the professional who should be concerned with whatever may have an impact the patient’s health.

Lesbian women and gay men also have to interact with hospitals and other healthcare facilities that often do not recognize the rights of a nonmarital partner to determine the course of treatment or to visit in an intensive-care unit unless they have obtained either a power of attorney or have officially been designated as a “healthcare proxy.”

Although lesbians have the lowest rates of sexually transmitted diseases of any orientation group, they also have some special concerns that would not apply to heteroerotic women, but would apply to bisexual women. Those issues are related to the fact that this person is sexually active with another woman. There is some debate concerning whether lesbians who are not sexually active with a man should have a Pap smear as often as a woman who is sexually active with a man. Additionally, if a patient tells the healthcare professional that she is a lesbian, the assumption is then made that she is not being sexually active with a man. This assumption should always be checked, because it is not necessarily true. A comprehensive sex history is needed to avoid incorrect assumptions, but is seldom done.

Gay men, on the other hand, have a high rate of sexually transmitted diseases. Prior to the 1980s, there was no major push for these men to wear condoms to prevent STDs, because most of the diseases could be cured by medical intervention. However, with the advent of HIV/AIDS, that situation changed, and the increased use of condoms in this population has significantly decreased the incidence of other STDs. The high frequency of sexual activity in many gay men means that their healthcare needs include concerns for the many diseases that can be transmitted sexually—and a comprehensive sex history is mandatory if the professional is to provide appropriate healthcare.

In the early 1980s, what we now know as AIDS was called GRID, Gay Related Immunodeficiency Disease, and it was believed that gay men were the only people who had it. While that has changed, the largest percentage of cases of AIDS in the United States continues to be among gay men, and part of gay-male identity is now referenced to HIV status, i.e., whether he is HIV-positive or HIV-negative. There is some concern about the effect that this has on one’s psychological health, with some people questioning the acceptance of that reference to “Gay Related” when the infectious potential of HIV is not influenced by a person’s sexual orientation.

Additionally, gay men have been likened in a psychological manner to Vietnam veterans, in that both have experienced the death of many people with whom close bonds had been established. There has been a suggestion that many gay men, particularly in the regions of the country that are hardest hit by the HIV/AIDS epidemic, are suffering from post-traumatic stress disorder and are in need of psychological treatment. Those lesbians who are very involved in the care of and are friends of HIV-positive gay men, are also experiencing trauma associated with multiple bereavement.

Another group that is receiving little attention in this epidemic are those gay men who are HIV-negative, who have lost partners to AIDS, and who are having to deal with survivor guilt and associated issues. Many of these men must also cope with the very strong feelings of pleasure that were associated with sexual activity before HIV became a threat. These men are at great risk for HIV infection; yet, in the mid-1990s, the public-health focus has turned to women and children at risk, generally ignoring gay men.

*[Brothers on the Down Low. Update 2003: “On the Down Low” or “DL,” refers to men who identify themselves as heterosexual but engage in sexual activities with other men. This behavior has long been known to exist in all races, but*

appears to be more common among African-American men than white men. The DL, a relatively new term, is maintained by the perception among many African-American men that if their double life were known, they would be shamed, stigmatized, and ostracized from the black community, which provides a safe haven from a racist society.

[The total number of black men on the “Down Low” is difficult to estimate. But according to the Centers for Disease Control in Atlanta, approximately 25% of black HIV-positive men who had sex with men consider themselves heterosexual. Experts are concerned that men involved in these secret sexual relationships are fueling the rising incidence of HIV among women (Denizet-Lewis 2003; King & Harris 2004). (End of update by H. Samuels)]

### *Homosexuality in the Later Years*

Very little is known about sexuality and aging among the estimated 3.5 million American men and women over age 60 who are homosexual. For gay men and lesbians, aging can create unique conflicts and problems. The death of a partner in a long-term relationship may bring out homophobic reactions among family members that lead these relatives to ignore the bereaved partner or contest a will and estate. Gay men and lesbians who decide to acknowledge their orientation after years of passing as heterosexual face the possibility of quite different outcomes when loved ones, children, and grandchildren, learn of their relative’s sexual orientation. Gay men, who are fearful that their orientation will be discovered as it becomes evident they are not going to marry, may adopt a loner life with relatively little sexual and social intimacy. Lesbian couples have to cope with two female incomes, which would usually be lower than most dual-career gay male or heterosexual couples (Friend 1987).

By necessity, gay men and lesbians develop skills in coping and crisis management, which give them an advantage in the aging process. More-flexible gender roles may allow older homosexuals to take aging more in stride and develop ways of taking care of themselves that seem comfortable and appropriate. “These skills may not be developed to the same degree among heterosexual men or women, who may be used to having or expecting a wife or husband to look after them” (Friend 1987, 311). Gay people tend to plan ahead for their own independence and security, whereas heterosexuals are more likely to assume that their children will take care of them in their old age. Homosexual men and women have significantly more close friends who serve as a “surrogate family” than do heterosexuals. In larger urban areas, organizations like Senior Action in a Gay Environment (SAGE) provide a variety of social and support services for older homosexuals.

### *Gay Men, Lesbian Women, and Bisexuals—Comparisons*

Because gay men are socialized as males and generally perceive themselves as males, their socialization process is somewhat different from that of lesbian women, who are socialized as females and generally perceive themselves as being female. This means that, from a general perspective, just as there are differences in male and female socialization, there are differences between lesbians and gay men, as well as differences among them. For example, in general analyses of gay and lesbian relationships, one difference often noted between the two is the role of sexual activity and sexual exclusivity. Generally, lesbian relationships are sexually exclusive and gay male relationships are not. This appears to be especially true of long-term relationships, and can be explained by the differences in socialization of women and men around sexual activity issues.

When gay men and lesbian women join together to form groups working toward a common goal, sometimes there are issues of power differentials and attitudes toward sexual activity that prevent the original goals from being reached by dividing the group along gender lines. Again, this can be explained by the differential socialization process.

It was not until the late 1980s that people identified as bisexual were welcomed into what were previously lesbian and gay organizations, and they are still viewed with caution in many circles. Bisexuals are sometimes accused by heterosexual people of being gay or lesbian and are labeled homophobic and fake by some homoerotic people. There are few bisexual support groups, most of them in large cities. The United States is only just beginning to attempt to understand the bisexual phenomenon.

### **C. Bisexuality**

CAROL QUEEN with ROBERT MORGAN LAWRENCE

The ambivalence about bisexuality is reflected in the history of the concept. For several years after the terms *homosexuality* and *heterosexuality* were coined in the late 1800s, bisexuality was largely ignored by the physicians and sex researchers who had newly medicalized sex. Sigmund Freud, with his theory of sexual development borrowed from Darwinian evolutionary models, helped to change that. By the 1920s, when Wilhelm Stekel wrote *Bi-Sexual Love*, the erotic capacity to desire both males and females could be envisioned as universal, if likely to be outgrown by adulthood. Havelock Ellis, by contrast, viewed bisexuality as a distinct sexual-orientation category, comparable to both homo- and heterosexuality.

Alfred Kinsey (1948, 1953) conceptualized bisexuality not in evolutionary terms, as the Freudians tended to do, but in simple behavioral terms. In his sexual-orientation scale, bisexuality was represented on a continuum between exclusive heterosexuality (the 0 end of Kinsey’s scale) and exclusive homosexuality (at 6), with a Kinsey 3 equally attracted to or having had sexual experience with males and females.

Since most humans experience their erotic desires and relationships in a social context, many (perhaps most) bisexuals have more sexual experience with one or the other gender, depending upon whether their social affiliations tend to be mostly heterosexual or homosexual. Indeed, researchers have noted that many people who have displayed “bisexual” behavior over the lifespan—that is, people who have had sexual experience with both males and females—tend to identify sexually according to the gender of their current partner (Blumstein & Schwartz 1983). This is reported as especially true of women. When the current partner is female, women are more likely to identify themselves as lesbian, and when the current partner is male, as heterosexual. Factors such as political or social affiliation can also lead an individual to—or away from—a bisexual identity.

One common stereotype about bisexuals suggests a person is not “really” bisexual unless he or she is a Kinsey 3. This is related to the presumption that the individual is “really” homosexual but hiding behind a heterosexual relationship. The notion that all, or most, people are “really” homosexual or heterosexual has been termed “monosexuality.” Monosexuals are individuals who desire members of only one gender, whereas bisexuals desire both. The term was apparently first used to describe hetero- and homosexuals by Stekel (1922). Today, this term has gained new currency in the American bisexual community as bisexuals seek to understand and combat the sources of stereotyping and social opprobrium they term “biphobia” (Hutchins & Kaahumanu 1991). Expressions of biphobia encompass caustic dismissals, such as Bergler’s (1956) “Nobody can

dance at two different weddings at the same time"; difficult relations between bisexual women and some lesbians (Weise 1992); and media-fed concerns that bisexual men are "spreading AIDS" into the heterosexual population. (The latter concern ignores the possibility that bisexual men can be as responsible about safe-sex practices as anyone else, that heterosexuals may also contract HIV from other heterosexuals, and that bisexual men may choose to live monogamous lives with female—or male—partners.)

Until recently, American bisexuals had few sources of support for their sexuality unless they derived it from the gay community—which has been far from uniformly supportive. In fact, it should be noted that many gays deny the reality and/or possibility of bisexuality. In the 1970s, a few support groups for bisexuals were formed; the best known of these was San Francisco's Bisexual Center. By the late 1980s, groups and organizations had emerged that aimed specifically to develop a supportive bisexual community; at the time of this writing, these are extensively networked and are producing their own publications and conferences.

Because of insufficient support, the influence of negative and alienating stereotypes, and the apparent fact that many bisexuals have lived as lesbians, gay men, or heterosexuals, it has been difficult to estimate what percentage of the population is, or has been, bisexual. It is probable that many more people have bisexual histories than would answer affirmatively to a survey researcher asking "Are you bisexual?" Too, many researchers have conflated or collapsed homosexuality and bisexuality (for a recent example, see Laumann et al. 1994), a further indication that many still consider one a variant of the other.

To stress the multidimensional nature of sexuality, Fred Klein (1985) developed his Sexual Orientation Grid, which expands Kinsey's concept of the continuum. He considers not only experience and desire, but also dreams, fantasies, social networks, relationships, ideal sexual orientation, and other variables. Additionally, Klein breaks the scale into temporal units (adolescence; early adulthood; present) so it can better reflect changes in behavior and sexual identity over the lifespan. Coleman (1987) has also developed a scale that takes factors like these into account and that serves as a clinical interview tool. Researchers using these scales, as well as Kinsey's, find that, although some display continuity of sexual identity over the lifespan, other individuals change identity over time. Many rate themselves near the middle of the Kinsey scale when asked their ideal, but report their relationships fall closer to one or the other end.

That behavior and identity are not fixed (and are sometimes not even consonant) is of special interest and relevance to researchers of bisexuality. The differences between homosexual and heterosexual may be less important and intriguing than those between monosexual and bisexual. Why, for example, is a prospective partner's gender of primary importance to some (monosexuals) and not to others (many bisexuals)? Other researchers note that bisexuality assumes different forms in different cultures, subcultures, and individuals. Klein (1978) suggests four primary types: 1. sequential (in which an individual will alternately partner or engage in sex with only men, then only women); 2. concurrent (in which an individual partners and/or engages in sex with both genders during the same period of time); 3. historical (bisexual behavior in an individual's past, especially adolescence); and 4. transitional (through which a heterosexual moves toward homosexuality or a homosexual moves toward heterosexuality).

Other American researchers have concentrated not on the taxonomy of bisexuality, but on the development and adjustment of bisexuals in day-to-day life. Some of this re-

search has been incidental to studies done on gay and lesbian or heterosexual populations; other researchers have looked at self-identified bisexual populations. Just as estimates on the percentage of bisexuals in the population are inconclusive, so is information about what percentage of people who have a history of sexual experience with both genders defines themselves as bisexual. What differentiates those who do from those who do not is still a matter of speculation, although research into the formation of bisexual identity suggests that, at least for them, identity formation is more open-ended than linear.

A common monosexual accusation is that bisexuals are "confused." Although this may be descriptive of some bisexuals before they find the label with which to self-identify, and some may also experience ongoing distress or uncertainty because of the dearth of societal validation (Weinberg & Williams 1994), some research has indicated that self-identified bisexuals are high in self-esteem, self-confidence, and independence of social norms (Rubenstein 1982; Twining 1983).

Much more attention has been given to bisexuals, especially males, who are heterosexually married than to those whose primary relationships are homosexual. These marriages are most successful when the partners communicate openly, the spouse is aware and accepting of the bisexual partner's sexuality, and both partners are committed to the relationship. Especially as the bisexual community brings self-identified bisexual people together, more bisexuals are choosing to partner with other bisexuals. These relationships may be monogamous, open, polyamorous, or—much more rarely—triadic.

Bisexuals bringing issues related to their sexual identities into therapy may seek help in interpreting their attractions to both genders; other issues are isolation and alienation, fears about coming out or about nonvoluntary disclosure of their sexuality, and relationship concerns.

What bisexual community spokespeople call "bisexual invisibility" hinders many individuals from easily resolving their concerns about adopting a non-normative sexual identity. Many do not know about the existence of a community of peers. While some individuals move towards a bisexual identity after considering themselves heterosexual, others have previously been gay- or lesbian-identified. As such, diversity in the bisexual community is broad, and will undoubtedly become broader as more people gain access to its institutions.

#### D. Orientations: A 2003 Update and Commentary

DAVID L. WEIS

[*Update 2003*: In March 2000, the state of Vermont enacted a law granting legal recognition to same-sex unions. Some of Vermont's 250 town and city clerks vowed to defy the law and not grant civil unions. The Catholic Bishop of Vermont called for religious Americans to pray and work for a constitutional amendment that would bar civil unions. Opponents of the new law quickly introduced a "Defense of Marriage" bill to ban same-sex unions and marriages. Within months, 33 states had enacted laws banning same-sex marriages and the U.S. Congress passed a law allowing individual states not to recognize the civil unions or marriage of a same-sex couple from another state.

[Despite the growing disputes, this legal breakthrough set the stage for an even more giddy time in the summer of 2003 for advocates of human rights for GLBT (gay, lesbian, bisexual, and transgender) people.

- Three of the seven provinces in Canada made gay marriage legal, when a federal court ruled that provincial

bans on gay unions or marriages violate Canada's constitution.

- In July 2003, the Supreme Court of the United States ruled that sodomy laws banning homosexual behavior are unconstitutional. The ruling enraged conservatives (see Legal Issues in Section 6B, Adults, above).
- The hippest television show in the summer season, "Queer Eye for the Straight Guy," was Bravo/NBC's "hilarious reality show in which five gay connoisseurs of fashion, grooming, interior design, food and culture rebuild a clueless hetero from the ground up" (Gordon & Sigismund 2002; Wilson 2003).
- The Vatican released an instruction declaring that "Laws in favour of homosexual unions are contrary to right reason [and a] grave detriment to the common good. . . . The Catholic law-maker has a moral duty to express his opposition clearly and publicly and vote against it. To vote in favour of a law so harmful to the common good is gravely immoral."

[The next day, President Bush equated gay marriage with "sin" and said he would support an amendment to the U.S. Constitution that would ban gay marriages.

- After 70 years of advising brides how to walk down the aisle and celebrate their wedding, a full-page article in *Bride's* magazine discussed recent developments in same-sex ceremonies. Gay and lesbian couples told why they want their friends and community to recognize their unions publicly. The article also offered advice on how to be a good guest at a gay union or wedding.
- By the summer of 2003, many of the nations newspapers, *The New York Times*, *St. Louis Post-Dispatch*, *Charlotte North Carolina Observer*, and *Boston Globe* among them, were publishing announcements of same-sex commitments in their wedding pages.
- In July, the nation's attention was focused on public debate at the National Convention of the Episcopal Church in the U.S. where bishops, clergy, and laity passionately debated whether or not to confirm the election of Rev. Canon V. Gene Robinson as Bishop of the Diocese of New Hampshire. Robinson had been selected from dozens of candidates, even though he acknowledged being in a relationship with another man for 14 years. The day before the convention was scheduled to vote, there was a delay, when allegations emerged that Robinson had engaged in "inappropriate touches" with another man and was connected to a pornographic website. When neither allegation was substantiated, Robinson was confirmed as the first openly homosexual Bishop in the Anglican Communion. The possibility of a schism heated up, as conservative American Episcopalians aligned themselves with African and Asian bishops who also strongly opposed the election and confirmation of a homosexual. The Archbishop of Canterbury quickly called for a meeting of top officials in October to find a way to avoid a schism among the 2.3 million members in the U.S. and the 70 million in the worldwide Anglican Communion.
- Following the vote confirming Canon Robinson as Bishop of New Hampshire, tensions and anxieties were very obvious, with everyone at the Minneapolis Convention wanting to avoid a global schism in the Church of England. Further conflict seemed inevitable, since discussion and a vote on whether or not to give full church approval to gay unions and appoint a commission to write a ritual for gay unions to include in the *Book of Common Prayer*. In a sensitive and delicate compromise, the Convention acknowledged that "differences exist" among the bishops about whether such blessings

should be allowed, but the Convention "recogniz(ed) that local faith communities are operating within the bounds of our common life as they explore and experience liturgies celebrating and blessing same-sex unions." The compromise effectively left the decision of blessing gay unions up to the local pastor and bishop.

- Some credible scientific evidence was announced that the likelihood of acquiring the HIV virus through oral sex is negligible (Page-Shafer et al. 2002).
- In the midst of the media blitz over homosexual issues and breakthroughs, a New Jersey survey revealed that likely voters in that state favored granting legal recognition of gay/lesbian marriages by 55% to 41% and legal recognition of gay/lesbian unions by 69% to 26%. The New Jersey courts were expected to rule shortly on whether the state would recognize gay unions.

[In the summer of 2003, television brought all of these events to the attention of families watching the evening news, evening after evening, across the nation and around the world. Even small local newspapers felt compelled to report these events, often in front-page headlines, and with commentary, pro or con, on the likely social consequences of these events. What happened in the summer of 2003 was not a series of isolated events that transpired behind the closed doors of one church, one magazine, one television network, or in a 2.7-minute newscast, sandwiched between news from Iraq or North Korea. The debates over a gay bishop and a same-sex ritual affected not just a large mainstream church in the U.S. They affected the Anglican communities in Asia, Africa, Europe, and North America. The media saturation reports of these events had some impact on the consciousness of all Americans: They influenced the subconscious attitudes and awareness of basic sexual issues. More or less, these same events were also affected by the civil recognition of gay marriages in Belgium and the Netherlands, and the acceptance of gay unions in Canada and its provinces, France, Germany, some jurisdictions in Spain, and the Scandinavian countries.

[I cannot remember such a series of encouraging events in North America in my lifetime. Celebration seems appropriate. On the other hand, this will certainly unify the social forces opposing these changes to renew their battle. There still is support in the U.S. Congress for the Defense of Marriage Act (Casert 2003). Only days after the sodomy ruling, congressional Republicans and President George W. Bush announced their intention to pass legislation that would ban homosexual marriage in the U.S. (Mann 2003). I suspect the issue will increase the polarity already rampant in American politics. However, I do not believe it will stop the now century-long trend toward greater sexual freedom for adults.

[All of this has also served to remind me just how little we know about GLBT persons, lifestyles, and issues. In the last decade, there has been increasing recognition of the need to study how GLBT people are related to quality of life, health, and mental health (Bailey 1999; Cochran 2001). Some of this may depend on how these groups are defined. For example, Cochran, Sullivan, and Mays (2003) found that, for both males and females, groups of homosexual and bisexual persons (combined) were more likely to experience a wide range of mental health difficulties (depression, suicide attempts, etc.) than persons who were heterosexual only. In a study of a national sample in the Netherlands, researchers found that a combined group of homosexual and bisexual men, but not women, experienced a lower quality of life than heterosexual-only men. Persons with lower quality of life were also found to have lower self-esteem and more external locus of control (Sandfort, de Graaf, & Bijl

2003). In contrast, Horowitz, Weis, and Laflin (2001) found few quality-of-life, social-background, or health-behavior differences among separate groups of heterosexual, homosexual, bisexual, and asexual respondents in a national study of the U.S.A. Since research in this area is still in its infancy, we have much to learn before resolving these apparently contradictory findings.

[Serious scientific questions also remain about how stable GLBT identities are, versus their susceptibility to change over the course of the lifecycle. Recently, Diamond (2003a) conducted a study of women who identified themselves as lesbian and/or bisexual at the beginning of a five-year study. Over a quarter of the women relinquished that identity during the period of the study. Interestingly, the women did not report that their pattern of attraction to same-sex persons had changed. Rather, their interpretations of what this meant had changed. Half of them decided they were heterosexual and half gave up all identity labels. Findings such as this suggest that sexual orientation may be more flexible than most previous models have maintained.

[Finally, perhaps the time has come for sexual scientists to begin a debate as to whether the very concept of sexual orientation is a useful one. Certainly, there is growing recognition of the complexities of experience and identity embedded within the labels of GLBT. The penultimate example of this complexity may well be the model of sexual orientation proposed by Klein, Sepekoff, and Wolf (1985). They maintained that orientation could vary along seven dimensions (such as behavior, fantasy, attraction, relationships, etc.) in any of three different time periods, creating 21 different cells or types of orientation. To say this would make research difficult is an understatement. In a review of the literature, Diamond (2003b) recently described evidence that orientation toward romantic partners and sexual desire are independent. All of this makes me wonder if the characterization of people as GLBT serves to help us or hinder us from greater understanding.

[Personally, I have found myself becoming fond of the label “men who have sex with men,” a construct that is common in research on HIV. Of course, there are also “women who have sex with women.” There are two reasons I like this terminology. First, it is relatively explicit about just who is and is not included in the group—people who behaviorally engage in sexual activity with members of their own gender and/or sex. Second, it promotes the idea that not everyone who engages in such behavior is the same in other respects. Getting *everyone* to understand this point strikes me as a good goal for sexual scientists as we begin the 21st century. (End of update by D. L. Weis)]

## 7. Gender Diversity and Transgender Issues

### [A. Intersexuality and the Politics of Difference

ROBERT T. FRANCOEUR

[Update 1997: On March 12, 1993, the “Op-Ed” page of *The New York Times* carried a full-page reflection on “How Many Sexes Are There?” The March/April issue of *The Sciences*, published by the New York Academy of Sciences, featured an article on “The Five Sexes: Why Male and Female Are Not Enough.” These articles, by biologist Anne Fausto-Sterling, are evidence of a trend in changing definitions of gender roles over the past decade that is echoed in the appearance in 1995 of *Hermaphrodites with Attitudes*, a newsletter published by cross-gendered persons who endorse Fausto-Sterling’s call for the medical profession to recognize gender diversity and cease using surgery and gender reassignment to force true hermaphrodites (“herms”),

female pseudohermaphrodites (“ferms”), and male pseudohermaphrodites (“merms”) into the dichotomous mold of male or female. (End of update by R. T. Francoeur)]

[Update 1998: In the past ten years, female impersonators, transvestites, and other gender-bending images have become popular subjects of television talk shows and prime-time television “magazines” like *Prime Time Live* and *60 Minutes*. Major films have made cross-dressing and transvestite issues a common theme—to mention a few: *La Cage Aux Folles* and its remake *The Bird Cage*; *Yentl* (with Barbra Streisand); *Victor/Victoria* (with Julie Andrews); *Tootsie* (with Dustin Hoffman); *Mrs. Doubtfire* (with Robin Williams); *M Butterfly*; *Adventures of Priscilla, Queen of the Desert*; *Glen or Glenda*; *Farewell My Concubine*; *Just Like a Woman*; *Different for Girls*; *The Sheltering Sky* (with Debra Winger); *Bull Durham* (featuring a rookie pitcher who wears a garter belt under his uniform); *Love Compassion and Valor*; and *To Wong Foo, Thanks for Everything, Julie Newmar* (featuring Wesley Snipes, John Leguizamo, and Patrick Swayze). RuPaul, a stunning six-foot-seven African-American drag queen has gained national recognition as a model for GLAM Lipstick and as a popular television talk show host and radio disk jockey. Rudolph Giuliani, the former mayor of New York, appeared comically at several public events in drag. Dennis Rodman, Chicago Bulls professional basketball player, has also appeared in drag several times, including once dressed as a bride. Female impersonation, cross-dressing, and transvestism seem to be “in vogue camp.”

[In 1992, the polymorphous San Francisco culture saw the birth of Transgender Nation, an energetic transgender political movement, developed out of Queer Nation, a post-gay/lesbian group, which sought to transcend gender-identity politics. Transgender Nation made news when some members were arrested for protesting the psychiatric labeling of transsexuality as a mental illness at the American Psychiatric meeting. About the same time, openly transsexual scholars, including Susan Stryker and Sandy Stone, became visible in academic positions at leading universities.

[Whether this broad spectrum of transgendered persons becomes significant in the long term of American sexual culture is not at present clear, but its synchronicity with the recent emergence of a very small but potentially important activist group of transgendered persons is worth investigation. In 1993, Cheryl Chase founded the Intersex Society of North America. ISNA’s immediate goal was to “create a community of intersex people who could provide each other with peer support to deal with their shame, stigma, grief, and rage, as well as with practical issues such as how to obtain old medical records or how to locate a sympathetic psychotherapist or endocrinologist.” According to Chase,

ISNA’s longer-term and more fundamental goal, however, is to change the way intersex infants are treated. We advocate that surgery not be performed on ambiguous genitals unless there is a medical reason (such as blocked or painful urination) and that parents be given the conceptual tools and emotional support to accept their children’s physical differences. While it is fascinating to think about the potential development of new genders or subject positions grounded in forms of embodiment that fall outside the familiar male/female dichotomy, we recognize that the two-sex/gender model is currently hegemonic and, therefore, advocate that children be raised either as boys or girls according to which designation seems likely to offer the child the greatest future sense of comfort. Advocating gender assignment without resorting to normalizing surgery is a radical position given that it requires the will-

ful disruption of the assumed concordance between body shape and gender category. However, this is the only position that prevents irreversible physical damage to the intersex person's body, that preserves the intersex person's agency regarding their own flesh, and that recognizes genital sensation and erotic functioning to be at least as important as reproductive capacity. If an intersex child or adult decides to change gender or to undergo surgical or hormonal alteration of his/her body, that decision should also be fully respected and facilitated. The key point is that intersex subjects should not be violated for the comfort and convenience of others (Chase 1998).

[ISNA has publicized its message and activist agenda with an astute and effective use of the media, including: Public Broadcast Radio and Television; publications like *The New York Times*, *New York Post*, *Mademoiselle* (February 1998), *Rolling Stone* (December 11, 1997); a special issue of *Chrysalis* (published by AEGIS, the American Educational Gender Information Service); a newsletter titled *Hermaphrodites with Attitude*; dialogues and protest demonstrations at medical meetings; and articles in professional journals, such as *Urology Times* and *Archives of Pediatric and Adolescent Medicine*.

[Of particular interest is the use ISNA has made of the Internet to connect and cooperate with other groups, including: the Turner Syndrome Society, Androgen Insensitivity (AIS) Support Group, Klinefelter's Syndrome (K.S.) & Associates, the Ambiguous Genital Support Network, Hermaphrodite Education and Listening Post (HELP), the Gay and Lesbian Medical Association, the Workgroup on Violence in Pediatrics and Gynecology, the Genital Mutilation Survivors' Support Network (organized by German intersexuals), and Hijra Nippon (organized by activist intersexuals in Japan). (*End of update by R. T. Francoeur*)]

[*Update 2003*: In the early 1990s, Cheryl Chase used the Internet and World Wide Web very effectively to organize an advocacy group to change the standard medical practice of performing genital surgery on newborns with ambiguous or intersex genitals. When Chase retired as the director of the Intersex Society of North America (ISNA) in early 2003, ISNA had persuaded many pediatricians to postpone genital surgery on infants unless the condition was life-threatening. With new leadership, ISNA is pursuing its goal of systematic change in medical practice to end shame, secrecy, and unwanted genital surgeries for people born with an anatomy that someone decided does not meet the medical criteria for a standard male or female. In ten brief years, ISNA has achieved its goal of persuading the medical community to use a model of care that is patient-centered, rather than concealment-centered ([www.isna.org](http://www.isna.org)). Among the recommendations ISNA is pressing with physicians are the following:

- An intersex or hermaphrodite person is an individual (of any age) born with ambiguous genitals. Intersexuality needs to be considered as a problem of stigma and trauma, not as a gender problem.
- The distress of parents must not be treated by surgery on the child.
- Professional mental healthcare is an essential for both the intersex persons and the family.
- Honest, complete disclosure is good medicine.
- All children should be assigned as boy or girl, without early surgery.

[From the 1950s into the 1970s, it became standard medical procedure to treat newborns with ambiguous genitals with cosmetic surgery designed to bring their genitals into conformity with what was then considered the norm for

male or female. Based on what was known (or assumed at the time), psychologists believed infants were born with a "blank slate," so to speak, and grew into their gender as a male or female. It was then also assumed that when a child was born with ambiguous genitals, cosmetic surgery and strict rearing for the appropriate gender was the best way to produce a normal boy or girl. Over the next 30 years, these assumptions were increasingly challenged in a very controversial and emotionally charged case known in the clinical literature and the popular media as "the John/Joan case."

[It started in Winnipeg, Canada, on August 22, 1965, when a teenage mother gave birth to identical twin boys, Bruce and Brian. When the infants were 7 months old, the mother told her doctor that the boys cried when urinating. The doctor told the parents that the boys' foreskins were too tight and he prescribed circumcision. On April 27, 1966, in a tragic accident, the physician performing the circumcision with an electric cauterizing knife caused a severe injury to Bruce's penis and testes. After a few days, the penis dried up and fell off, leaving only a stub. Eventually, after desperate attempts to find someone who could help them deal with the problem, the parents were recommended to Johns Hopkins Hospital where John Money was a world-renowned expert on psychosexual development. Money had been pioneering treatment of adult transsexuals using a sex-change operation. At age 17 months, the decision was made to surgically turn "John" into a girl and raise her as "Joan." The testes were removed so they would not produce male secondary sex characteristics. Estrogen replacement and vaginal surgery in the adolescent years would complete the work of gender reassignment.

[Early reports suggested a perfectly normal gender-identity development for the reassigned girl (Money & Tucker 1975, 91-99). However, in a 1979 report on British television, Williams and Smith reported that "Joan" experienced considerable difficulty in adjusting to her female gender role. Then in her teens, they reported she was displaying symptoms that made them "suspicious that she will ever make the adjustment as a woman." Finally, after years of detective work to find out what actually happened to Brian after his father finally told him the whole story, Milton Diamond, a sexologist at the University of Hawaii School of Medicine, published a report in the *Archives of Pediatric and Adolescent Medicine* (Diamond & Sigmundson 1997). David had reasserted his male gender and had had reconstructive surgery to recreate male anatomy. He had married and was enjoying being an adoptive father. A sensational story in *Rolling Stone* and a book titled *As Nature Made Him: The Boy Who Was Raised as a Girl* (Colapinto 2000) followed, with television appearances on Oprah, ABC, *Dateline*, the BBC, *60 Minutes*, and more.

[In 2003, we know much of David's story, from his infancy as Bruce to the surgical accident, his childhood and teen years as "Joan," and his current life as David. But there is also much we have yet to learn about this tragic and complex story. One thing we do know, however: There are aspects of our gender that are encoded in the neural pathways of our brain before birth. And this encoding is irreversible. Cheryl Chase and the intersex members of ISNA have used David's story and their own stories as persons born with ambiguous genitals to establish a new medical treatment based on the rights of an "intersex" child not to be subjected to genital surgery until they can make their own decision how they want their condition to be treated. (*End of update by R. T. Francoeur*)]

[*Update 1998*: It is estimated that one in 100 infants are born with some anomaly in sex differentiation, and about one in 2,000 newborns are different enough to make their gender

assignment as “boy” or “girl” problematic. Thus, the members of ISNA would appear to have minuscule potential for achieving their goal of persuading society to accept a “politics of difference” with recognition and valuing of other-gendered persons. A minority as small as ISNA would seem to have little chance of successfully challenging the prevailing medical paradigm of immediate surgical intervention to remedy sexual ambiguity (Coleman 1991). However, as medical ethicist Karen Lebacqz (1997) has observed,

The politics of difference has emerged out of the self-identification of groups that may be minorities in society but that are large enough to become a political force. . . . [T]he advent of new technologies such as the Internet may facilitate the process, as individuals who are widely scattered geographically can find each other and form connections and agendas.

[Only the future will tell whether American society is at a watershed where reconstructions of societal and individual responses to gender are possible. Whether the mass media and Internet are powerful enough to enable American culture to replace its all-prevailing gender dichotomy with a “politics of difference,” similar in some respects to the valuing of “third-gendered persons” in other cultures, remains to be seen. (*End of update by R. T. Francoeur*)]

**B. Cross-Gender: Overview, Issues, and Persons**

ARIADNE (ARI) KANE [*Rewritten and updated in June 2003 by A. Kane*]

*An Indigenous View*

American society, with its cultural diversity, has long assumed that one’s gender perception, role, and presentation are all a function of biological anatomy, as visually ascertained at birth. This biocentric viewpoint served as the basis for looking at sexual and gender variations for both sexologists and therapists. Until the mid-1970s, many sexual and gender options were seen and diagnosed as deviations from the male/female anatomical/medical model. Gender options, as style modes of clothing and accouterment, gender shifts, and transsexualism were viewed as dis-eases [sic] of the psyche. Those who chose such options were considered “gender-conflicted” and were treated on the basis of known medical or psychological modalities (Pauly 1994).

Factors contributing to the current trend of changing gender roles include the rise and powerful articulation of feminism among both women and men; the knowledge explosion in molecular biology, specifically genetics and endocrinology; artistic diversity in both the visual arts and music with their individual styles and presentations (with cinema, television, and music increasingly dealing with gender and cross-gender issues); the emergence of an articulate, vocative, and visible gay-lesbian-cross-gender “community”; and the influence of computer technology and its application in almost all sectors of American life. The impact of these factors on the daily lives of Americans—how they think, how they feel both about themselves as well as society, and how they act and present themselves to each other—has been awesome.

[From this social context, there is an incentive to challenge the biocentric notions about perceptions and gender roles as derivative of the dimorphic nature of *Homo sapiens*, i.e., two sexes implies only two gender forms. This challenge to gender rigidity, in roles and presentations, is seen in many areas of American social and economic life. Women as bus drivers and heavy-equipment operators and men as nurses and secretaries represent only one aspect of the varied paradigm shift occurring in America in the nature of gender identity and its concomitant behaviors. Instead of a binary

**Table 15**

**The Transgender Phenomenon: A Flow Chart**

<b>Group A</b>	
Bigenderist	A person who can comfortably express him- or herself in either a conventional or nontraditional gender role
Transgenderist	A person who wants to live permanently in an alternative gender-role form, either traditionally or unconventionally
Androgyne	A person who desires to blend traditional gender-role behaviors (e.g., many rock stars—David Bowie, Mick Jagger)
Gender Bender	A person who engages in dissonant gender-role presentations and behaviors (female or male dressed in conventional modes with moustaches or beards)
<b>Group B</b>	
Masculine Impressionist	Females who perform on stage as men
Femme Impressionist	Males who perform on stage as well known women singers or comics
Cross-Dresser	Males or females who desire/choose to wear an item or items of apparel or accessories or use enhancers (makeup) typically worn or used by the other gender category
Transvestite	Historically, an adult male who wears an item or items of feminine apparel and accessories to create an image of a woman/girl. Some adult females have also been known to wear items of masculine apparel to create an image of a man/boy
Drag King	Any female who presents a complete visual masculine image in various social/public settings
Drag Queen	Any male who presents a complete visual feminine image in various social/public settings
<b>Group C</b>	
Transsexual	Males or females who have chosen a preferred gender role (transgenderist) and wants biologic congruity with that gender-role preference. This process involves an appropriate sex hormonal therapy, cosmetic, surgical, and sex reassignment
Intersexual	Individuals who are diagnosed as having ambiguous biologic genitalia are labeled intersexed or hermaphrodites

model for sex and gender, there is a need for a new model consisting of several distinct biologic sexes (see Fausto-Sterling) with concomitant gender forms (see Table 15). One needs a model of two or more sexes and many genders. Here, a sociocentric view of gender, in which one can think of gender in terms of three basic parameters: perception (Jungian constructs of *anima/animus*), social role (cuing, interactions, and gender-role inventories), and presentation (modes of presenting one’s self, for whom, when, motivations, etc.). Thus, the gender of a person is seen as a composite of these three parameters in dynamic equilibrium, time-dependent and ever-changing, over the lifespan.

[In addition to the sociocentric view of gender, there are other models that focus away from gender-conflict issues

toward other facets of gender diversity. These include concepts like the “gender rainbow” paradigm suggested by gender counselors Leah Cahan Schaefer and C. Christine Wheeler, June Reinisch’s concept of “gender flavors,” and James Weinrich’s model of “gender landscapes” (see Francoeur 1991, 100-101). In each of these models, gender-conflict issues are broadened to include gender explorations and gender clarifications. For the cross-gender person, these models provide alternative avenues in their search for personal growth in a tolerant and more nurturant society. For the healthcare professional, the sociocentric model of gender and selected use of the above concepts provide a realistic basis for studying CD/CG (cross dressing/cross gender) behavior. It is also a more sensitive approach to the issues and problems of gender expression in a multicultural American society.

Traditionally, the terms “transvestite” (TV) and “transsexual” (TS) have been used to label individuals, mostly males, who wear apparel usually associated with the other sex, or who want to cross a gender boundary and seek anatomical congruity with the other sex. These terms are too inclusive and stigmatize the person, who may be on a gender exploration, or who sees personal gender expression as only one piece in their total personality matrix. To deal with this limitation, the following new glossary has been proposed, with the terms serving as “mileposts” on the road to gender “happiness:”

- A “cross-dresser” (CD) is a person, male or female, who wears an item or items of apparel usually worn by the other gender; it is a descriptor of behavior and includes previously used terms like TV (transvestite), FI (female impersonator), and DQ (drag queen).
- “Cross-gender” (CG) refers to a person, male or female, who desires to cross and explore a gender role different from typical gender roles associated with their biologic sex. It can also be used as a behavior descriptor.
- A “transsexual” (TS) is a person, male or female, who has chosen a preferred gender role and wants anatomical congruity with that gender-role preference. This can be accomplished by an appropriate sex-hormone-therapy program and genital-reconstruction surgery (GRS). *Note:* For a male-to-female (MTF) TS, this is known as vaginoplasty; for the female-to-male (FTM) TS, it is known as phalloplasty. Sex-reassignment surgery (SRS) is an outmoded phrase, replaced by GRS.
- “New Women/New Men” refer to persons, male or female, who have transitioned to a preferred gender role, i.e., transgenderist, and have had genital-reconstruction surgery.
- The “CD/CG/TS paraculture” refers to the community of people, males and females, whose general behavior patterns include a major component of gender-diverse activity.

The term “transgender” indicates that a person is crossing gender boundaries usually associated with traditional gender traits of one or the other sex. Transgender, transgendered, and transgenderist are also used to indicate transcending—rising above—traditional gender forms and expressions, a usage that has gained popularity both within the paraculture, as well as in the healthcare and academic professions.

#### A Clinical View

The term “transsexualism” was coined by D. O. Cauldwell, an American sexologist, and popularized by Harry Benjamin in the 1950s and 1960s. Research on this phenomenon was facilitated in 1980 when the concepts of

transsexualism and gender disorders were recognized in the American Psychiatric Association’s *Diagnostic and Statistical Manual III*. In 1988, transsexualism was defined by the *DSM-III-R* as having the following diagnostic criteria:

1. persistent discomfort and sense of inappropriateness about one’s assigned sex;
2. persistent preoccupation for at least two years with getting rid of one’s primary and secondary sex characteristics and acquiring the sex characteristics of the other sex; and
3. having reached puberty (otherwise, the diagnosis would be childhood gender identity disorder).

*DSM-IV* has replaced the term “transsexual” with the generic term “gender identity disorder.”

Transsexualism is estimated to affect at least 1 in 50,000 individuals over the age of 15 years, with a 1:1 male-to-female ratio. The greater visibility of male-to-female transsexuals may reflect a more-negative bias toward male homosexuality or a lack of available female-to-male treatment in a society. Whatever the real incidence, this disorder carries more social significance and impact than the actual prevalence might suggest because of the questions raised for anyone who watches and listens to transsexuals (and transvestites) in their frequent appearances on television talk shows (Pauly 1994, 591).

An individual’s perception of his or her own body, and the way she or he feels about these perceptions, are important in the clinical diagnosis of gender disorders. In 1975, Lindgren and Pauly introduced a Body Image Scale, a 30-item list of body parts, for which the individual is asked to rate her or his feelings on a five-point scale ranging from (1) very satisfied to (5) very dissatisfied. This scale is useful in following the progress and evaluating the success of genital-reconstruction surgery (GRS).

Evaluating the outcome of genital-reconstruction surgery is complicated and difficult. The most recent evaluation leaves little question that the vast majority of post-operative transsexuals claim satisfaction and would pursue the same course if they had to do it again. Post-operative satisfaction ranged from 71.4% to 87.8% for post-operative male-to-female transsexuals, with only 8.1% to 10.3% expressing dissatisfaction. Among female-to-male transsexuals surveyed, 80.7% to 89.5% were satisfied with their outcome, compared with only 6.0% to 9.7% who are not satisfied. The difference between male-to-female and female-to-male satisfaction was not statistically significant (Pauly 1994, 597).

The publicity that followed the American Christine Jorgenson’s sex-change surgery in Denmark in 1953, led to widespread public and professional discussion, and ultimately a distinction between transsexualism and transvestism. Harry Benjamin developed a three-point scale of transvestism, with transsexuals viewed as an extreme form of transvestism; he later came to regard the two as different entities.

The variety of cross-dressers includes fetishistic females and males who cross-dress for erotic arousal and those who enjoy cross-dressing to express their feminine or masculine personas; it includes individuals who cross-dress and live full-time in the other gender role, and those who cross-dress only occasionally and/or partially, with the whole range between these two ends of the spectrum.

In the 1960s, Virginia (Charles) Prince, a Los Angeles transvestite, began publishing *Transvestia*, a magazine for heterosexual cross-dressers. Encouraged by the response, Prince organized a “sorority without sisters,” the Society for the Second Self or Tri-Ess (SSS), with chapters in sev-

eral major cities. As a result of her worldwide travels, lectures, and television appearances, research on transvestism increased significantly because of the availability of research subjects.

As the cross-gender movement grew and became more visible, dissident and new voices appeared. At present, there are a variety of support groups for cross-dressers; some accept only heterosexual or homosexual and bisexual members, while others are not concerned with orientation. Some CD groups include transsexuals, others do not. In addition, there is a small industry, including "tall or big girl" fashion shops and mail-order catalogs, that cater to the clothing and other needs of cross-gendered persons.

#### *Current Status of American CD/CG Paraculture*

It is apparent that many more American males and females are openly cross-dressing than at any other time in the last 100 years. The motivations for this activity are quite varied, ranging from female- or male-impersonation (FI, MI) as "Miss Coquette" or "Mr. Baggy pants" at a Halloween party, to lip-synching performances at FI and MI reviews (i.e., "La Cage aux Folles" or Mr. Elvis Presley look-alike shows), to femme expressions in daily activities such as work or socializing. While it appears less obvious, there are many more females who cross-dress with the intent of expressing some part of their masculine persona (*animus*).

In the last decade, there has been a dramatic increase in the number of social contact groups, both for males who cross-dress and want social contact with others of similar persuasion in a secure setting, and for females who want to explore more fully the dimensions of their masculinity. Both female and male adolescents are cross-dressing to reflect feelings of their favorite musical stars, e.g., k.d. lang, RuPaul, Boy George, Melissa Etheridge, Michael Jackson, or the Erasure or Indigo Girls rock groups. (It should be noted that several of these performers are also known to be gay or lesbian, perhaps creating some public confusion about the association between cross-dressing and sexual orientation.) There are also young people who show some affinity for atypical gender-role expression. These may be early phases of mixing aspects of traditional gender norms with explorations of the limits of gender duality, that may benefit from appropriate professional help.

One segment of this paraculture is definitely exploring gender options with the aim of resolving gender conflict. Such conflicts may not be limited to the intrapsychic, but extend into resolving tensions between the rights of individual expression and the norms of conventional gender roles and presentations. When the desire to "shift" gender is experienced, there is a need for professional help in understanding the motivation for the gender shift and to develop a program that will clarify some of the important questions that individuals may have to address in pursuing such a choice. Such a program of gender exploration or gender shift may involve the use of hormones and also the decision to have genital-reconstruction surgery. Some of these people label themselves transgenderists, in the sense noted above, and can fully develop and express an alternate gender role and lifestyle. Some may be satisfied with this shift and not want to pursue sex-reassignment surgery. For others, after living full-time for one-and-a-half to two years in the preferred gender role, the decision is to complete the shift with surgery, in which case, the label "transsexual" is appropriate.

Currently, more and more people are challenging the binary gender forms and want to explore other gender options. If surgery is not the ultimate objective, these individuals may choose to blend traits and become more androgynous

or gynandrous, expressing a feminine-masculine or masculine-feminine gender role. This segment of the paraculture is also receiving some attention.

As for legal issues involving CD/CG behaviors, most states do not have statutes that specifically prohibit the practice of CD/CG presentation in public. However, there may be some local ordinances that restrict this behavior in their jurisdiction. If tested in the judicial system, such laws would probably be ruled unconstitutional. Obtaining a legal change of name is not a problem in most areas of the country, and should be accompanied by some form of public notice for creditors, usually in the classified section of a local newspaper. Change of birth certificate may pose some problems; again, each state has its own guidelines.

With regard to genital-reconstruction surgery, a medical group created a set of guidelines for the preoperative transsexual about 1980. *Standards of Care* details guidelines for the client, the healthcare counselor/therapist, and the surgeon for handling the process of gender shift prior to surgery. These guidelines have been reviewed and updated to reflect cultural and professional changes in society. This document is available from any of the organizations listed at the end of this section. Few, if any medical-insurance plans pay for this surgery, which for a male-to-female runs about \$10,000 to \$15,000. In recent years, several reputable gender clinics have discontinued providing this surgery.

For healthcare professionals, sex educators, counselors, therapists, physicians, nurses, and sexologists, there are two major programs available to update one's knowledge about gender or to facilitate change in attitudes about gender issues. Segments in the standard Sexual Attitudes Reassessment (SAR) Workshop focus on CD/CG behaviors and lifestyles. In the Gender Attitude Reassessment Program (GARP), the focus is on all aspects of gender and its diversity; 10 to 15 units deal with specific topics in the phenomenon of gender. Both of these programs are given at national professional meetings and in continuing education programs at major universities and mental health centers in the United States.

Within the paraculture structures, there are several programs for CD/TG/TS/AN Americans. Two of the oldest and "personal-growth-oriented" are Fantasia Fair and Be All. Fantasia Fair, founded 28 years ago, provides a living/learning experience for adult male cross-dressers who want to explore the many dimensions of their femme persona in a tolerant open community. Fantasia events, often held at Provincetown on Cape Cod, Massachusetts, emphasize personal growth in all aspects of their programming. Be All, an offshoot of Fantasia Fair, focuses on the practical and social aspects of femme persona development. It is usually held in a motel/inn near a major city and is sponsored by a regional group of social contact organizations.

Organizations providing information on gender issues include:

Educational Institute for Sex and Gender Diversity (EISGD), 126 Western Avenue, #246, Augusta, ME 04330 (USA); email: infoisgd@aol.com

Harry Benjamin International Gender Dysphoria Association (HBIGDA), 1300 South 2nd St., Suite 180, Minneapolis, MN 55454; email: hbgda@famprac.umn.com.

I.C.T.L.E.P., Inc., 5707 Firenza St., Houston, TX 77035-5515.

The Society for the Second Self (Tri-Ess), 8880 Bellaire (B2pmb 104), Houston, TX 77036; email: info@tri-ess.org.

International Foundation for Gender Education (IFGE), P.O. Box 540229, Waltham, MA 02454-0229; www.ifge.org.

A comprehensive list of current transgender education and support groups can be found on the Web via Yahoo! Di-

rectory > Transgendered > Organization, and via Yahoo! Directory > Society and Culture > Cultures and Groups > Transgendered > Organizations. (*End of update by A. Kane*)

### [C. A Second View of Gender Diversity

C. CHRISTINE WHEELER

[*Conceptualizations: Gender—Its Experience and Expression, Then and Now*

[*Update 2003*: In the past decade, in the U.S., gender has become one of the most hotly debated issues in a dozen areas, including:

- medicine,
- physiological dilemmas,
- endocrine syndromes and effects in neuroscience,
- the politics of clinical diagnosis,
- psychological/psychiatric and management or treatment considerations,
- cultural tolerance or intolerance,
- social policies and their influence in legal systems and the law,
- religions, and
- individual rights and our concepts of freedom and expression.

[Conceptualizations of gender, sex, and sexuality have dramatically shifted from a traditional dualistic binary paradigm to new confrontations of gender bending, blending, and activism for diversity. The cultural and scientific challenges that are raised by the mere existence of transgender and transsexual individuals have forced simplistic ideas to explosion and exploration. Public disclosures (autobiographic and personal profiles in the mass media, and controversies, continue to educate the American people about gender conceptualizations and to foster passionate discussion about the meaning of male and female—still further challenging our understandings of gender. In the U.S., the lens of gender, in all its refractions, most recently has dramatically shifted in focus from a perspective or picture of pathology to one of sexual health and wellness.

[In both research and medicine, the gender identity-development-disorder's debate centers primarily on whether gender as a condition (Gender Identity Disorders, GID) should be considered a disorder or removed from the *Diagnostic and Statistical Manual (DSM)* of the American Psychiatric Association (APA) and declared a normal variant, in analogy to the 1973 decision of the APA on homosexuality. The intersex controversy focuses on the assignment of gender and related issues of psychosocial and medical management, particularly with newborns. The GID debate extends to intersexuality, because if intersex people have significant gender-identity problems, *DSM-IV* classifies them as GID Not Otherwise Specified (GIDNOS), which implies a mental-disorder status. The powerful emergence of the Female-to-Male (FTM) movement illuminates controversy in departures from traditional concepts of gender identity and diversity, and its influences within the transgender culture, healthcare, and public policy. The conflict in our judicial system has to do with historical concepts that create an impenetrable barrier of social policy enshrined as law. But that's now (Wheeler 2001, 2003; Wheeler & Schaefer 1997).

### [*Historical Influences*

[What was then? What was it like a few decades back, 30 to 40 years ago, in the beginning? Well, in a nutshell, there was little awareness, and few people interested or involved. In an historical snapshot, here's what was for American scientists to consider:

- Descriptions of gender-variant identities date back to classic Greek writings.
- The first specific reference in the medical literature was Friedreich in 1830.
- Current vaginoplasty dates from the late 19th century and Robert Abbe's pioneering use of skin grafts for construction.
- The surgical precursor to the current rectosigmoid vaginoplasty was reported in 1904 (Baldwin/Ann.Surg.)
- Bogoras, a Russian surgeon, first used the tubed abdominal flap for phallic reconstruction in 1936.
- Throughout the early and middle 20th century, various behavioral scientists contributed to the descriptive literature.

[By the late 1940s, pioneering endocrinologist and world-acclaimed "Father of Transsexualism," Harry Benjamin, M.D., working in New York City, became the first proponent of hormone therapy, presented his first paper at the New York Academy of Medicine in 1954, authored the first definitive text on gender conditions, and popularized the theory of Gender Identity Disorders as a real medical entity (Wheeler 1999). Ultimately, the initial success of Christine Jorgenson's highly publicized surgery abroad, combined with the efforts of Dr. Benjamin and others, led to the formation of the first gender-identity clinic at Johns Hopkins in 1963 with John Money, Ph.D.

[By the early 1970s, Dr. Jorge Burou of Casablanca, Morocco, and Dr. Stanley Beiber of Trinidad, Colorado, had reported on over 1,000 successful postoperative surgical procedures. At that time, surgical nomenclature had already shifted from "sex change" to "gender confirmation" and was well on its way to genital-restructuring surgical lingo. And, of course, Richard Green, M.D., J.D., was already following his "kids" expressing cross-gender concerns—a group of young people with GID, for the earliest longitudinal study of sexual identity development in children.

[However, physicians, along with academics, healthcare providers, and public policymakers, were reluctant to "join" others who were interested (Wheeler & Schaefer 1984a). They feared the consequences. That was then and that is now today, as well. A major exception, of course, was Dr. Harry Benjamin. His thanks and appreciation, however, were demonstrated by *no* New York City hospital wishing to accept him into their physician roster or on their board. But Benjamin's knowledge, his intuition, and his genius about what was right and most acceptably "human" kept him going in a gender-protective direction, even without the support or approval of his mainstream colleagues right into the 1980s.

[In fact, the scenario used to go something like this: People would get hormones and surgery by going to a doctor's office and saying "I want!" and the doctor would say "yes" or "no." That's all. No evaluating, no education, no support, no consequences, no interpretations, no lawsuits, no nothing! (Gemme & Wheeler 1977). Then the atmosphere changed. And then what happened was Dr. Harry Benjamin interviewed a transgendered person. Dr. Wardell Pomeroy, Alfred Kinsey's colleague, followed suit. Eventually, Paul Walker, Ph.D., Alice Webb, Donald Laub, M.D., and others joined Benjamin and Pomeroy to form the Harry Benjamin International Gender Dysphoria Association, which then developed and published the *Standards of Care*. Other factors leading to the current status were "The Letters" written by clinicians in support of hormones and genital surgery, clinical evaluations, the activism, and the involvement of lawyers (Pomeroy, Flax, Wheeler 1982; Wheeler 1993).

[Today, many clients are taking control of their own management and deciding not to take the option of genital

surgery (Wheeler 2003; Wheeler & Schaefer 1984b)—more arguing, more confusion, and *more* satisfied people because they have more options, and more and better care! (Wheeler & Schaefer 1999). As a noted research sociologist explains, one of the best ways to understand the rules of society is to study those that break the rules (Devor 2003).

[By the mid 1990s, the refinement of endocrinology in manipulating sex hormones, and public acceptance of plastic reconstructive surgeries to alter secondary sex characteristics to alleviate psychological distress fortified further acceptance for thousands of people to alter their gender expression and presentation. Body phenotype surgeries became routine for maxillofacial, genital, breast, and scalp reconfiguration to allow trans individuals greater satisfaction, with their bodies being more congruent with their gender and sex identities.

### [Current Status of American Trans People

[Today, the variety, diversity, and varied trajectories of thousands of people expressing gender change, with or without transitions, in the United States each year, has become super popular—the focus of talk shows, much controversy, the center of new documentaries, legislation, and change in advocacy, and the emergence of consumer-driven groups. Gender is so compelling in America today because everything about sex and sexuality is both known yet paradoxical. Variation in expression of switching gender has always been linked with cultural taboos—even today, people associate gender with sex.

[Today, in contrast with the silence of the first half of the 1900s, these debates are conducted in many diverse media, such as pamphlets, newsletter, websites, Internet lists and chat rooms, videos, newspaper reports, meeting presentations, college and even some senior high school courses, and scientific publications. Debates today focus on three major clusters of issues: gender feeling/expression/experience, gender-confirming procedures and surgery, and information management.

[The popularization of transgenderism in the news has included:

- Art and Entertainment Network's 2003 release of the acclaimed *Role Reversal* (Wheeler 2003b),
- ABC's *Boy or Girl? When Doctors Choose a Child's Sex*,
- Intersex Society of North American's *Hermaphrodites Speak*,
- Arts and Entertainment Network's *Investigative Reports: Transgender Revolution*,
- *Multiple Genders: Mind and Body in Conflict*,
- *XXX*,
- *You Don't Know Dick: Courageous Hearts of Transsexual Men*,
- *A Change of Gender*, and
- London's Richochette Television production, *History of the Sex Change*.

And, of course, there was the 2002 publication of the U.S. Surgeon General's report, *A Call To Action*, describing the nation's sexual health crisis and calling for:

- respectful dialogue among people with divergent opinions,
- acceptance of the diversity of sexualities, and
- thoughtful implementation of a range of programs.

Despite the debates stirred by the Surgeon General's *Call to Action*, the fact that this document was released is in itself an important positive step. (Ironically, paradoxically, another former U.S. Surgeon General was transgendered.)

[Further evidence of gender-related changes in the United States include: the city of San Francisco offering municipal employees sex-change treatment as part of their medical benefits plan, Florida transsexual Michael Kantaras winning custody of his two children, and *Teen People* magazine highlighting an article on transgendered teens on its May 2003 cover. It seems as though a new autobiography from a trans person is being promoted every other month, further increasing public awareness and attitudes, primarily in positive directions.

[In the winds of the times, prevailing policies, the critics, and their questions have all changed. Biological determinists, social constructionists, and activists alike contribute to solving the puzzle and the larger picture of what it means to be human.

[What has changed is our society and our scientific knowledge. We have witnessed a shift from 19th- and 20th-century thinking based on the assumption that one's biological sex, and the gender assignment made at birth because of it, will be followed by a gender/sexual identity, role behavior, sexual orientation, courtship and love, sexual functioning, and psychological health that falls in line, more or less, with societal expectations.

[For centuries, the definitive criterion of one's "true sex" was external genitality. In the late 19th and early 20th centuries, gonadal histology, and the sex chromosomes (for intersex) were added to the basic criteria. But each of these defining criteria can be ambiguous and may be discrepant from one another.

[The history of science teaches us that we see only a limited piece of the legendary mosaic. Many grasp a kernel of truth, but the entire entity eludes us because it is always much more than the parts we have our hands on. Further, many thinkers contend that there are far more "mistakes of society" than "mistakes of nature."

[Today, society's definitions of gender roles are changing, even as transgender individuals encounter more tolerance, enjoy the benefits of some legal protection, and exercise greater autonomy in medical decision-making. These changes influence the life experiences of gender-variant people (GID), along with the evaluation of long-term outcome, and the need to be considered in any revision of psychosocial and medical management. Planned policy changes should be informed by empirical data and followed by assessments of long-term outcome of new approaches. Guidelines should never be left to individuals. They should be arrived at by multidisciplinary committees of appropriate specialists with opportunities for input from others working in the specific area and individual patients or consumers themselves.

[And so the debates continue with passion, determination, and questions. While the progress that *has* been made in the present time (the now) is admirable, there is still too much prejudice—both among the workers in the field and among trans people themselves. It all has to do with *how* we look at each other and what we see!

[If Dr. Harry Benjamin were alive today, what would he say? In his 100 years, he answered this question often enough: "I'm not here to promote any particular operation or treatment. I'm here to try to promote scientific objectivity, open-mindedness and a bit of compassion." To which, Dr. Leah Cahan Schaefer and I would add "and a lot of compassion and love!" (Schaefer & Wheeler 1997; Wheeler 1988).

### [The Varieties of Operational Definitions

[In keeping with our changing conceptualizations of sex, gender, and transgender, our operational terms and definitions have likewise changed. Sometimes the changes

have been superficial, sometimes radical, even in the few years since Ari Kane composed his preceding “Indigenous Clinician’s View of the Current (1995) Status of American CD/CG Paraculture.” The basic terminology current in 2003 includes:

- *Sex*: social status based on genital appearance—a person may be female, male, intersexed, or hermaphrodite;
- *Intersexed* or *hermaphrodite*: social status assigned to a person having sex characteristics of both females and males;
- *Gender*: social status based on convincing performance of femininity or masculinity—persons may be girls or women, boys or men, or transgendered;
- *Transgendered*: persons who feel they do not fit well as either women or men, may be neither gender, both genders, or a gender different than what their sex would normally dictate. Such a person may appear ambiguously gendered to others, and may change their gender and live unnoticed as another gender; may also be known as a *cross-dresser* or *transvestite*, as well as *female impersonator*, *drag queen*, *androgynous* (one who presents both or neither gender), *fetishist*, and *autogynophile*;
- *Transsexed (Transsexual)*: persons designated as one sex and gender at birth, but identify themselves, and may even live, as another gender and another sex; many use various social, hormonal, and surgical techniques to sufficiently alter both their gender presentations and sex statuses to more completely express their feelings; today, many *trans people* identify as *trans women* (male to female, or *MTF*) and *trans men* (female to male, or *FTM*);
- *Gender or Transgender Community*: in the U.S. today, this collective group or loose association of people includes both those individuals expressing gender diversity or variance (sometimes known as consumers), as well as non-gender-diverse people and healthcare providers;
- *Gender Identity Disorder*: incongruence between the physical anatomic sex (phenotype) and gender identity, i.e., self-identification as male or female;
- *Gender Dysphoria*: the experience of gender incongruence; and
- *Sexual Identity*: basic personality feature with three overlapping component parts: (a) gender (core morphologic) identity, a basic awareness of being male or female, both, or neither; (b) observable gender role, expression of culturally typical feminine or masculine behavior; and (c) sexual orientation, or in brief, sex-partner attraction (same, both, opposite, none, or all stimuli—i.e., homo-, bi-, hetero-, or ambisexual).

[Many in the U.S. prefer the above tripartite operational definition of the last term “sexual identity” to other gender terminology, which varies worldwide. The most extreme form of experience and expression, in which a person needs to adapt their phenotype with hormones and surgeries for congruence with their gender identity, is called *transsexualism*. The complexities and definitions of the transsexual condition have been well articulated by Milton Diamond (2003, *Transgender Tapestry*, in press) in a chapter appropriately titled, “What’s in a Name? Some Terms Used in the Discussion of Sex and Gender.”

#### *[Etiology of Adult Transsexualism*

[There are no reliable statistics of trans people, but an educated, reasonable estimate would be between 2% and 5% of the general population, comparable to the most recent estimates of homosexuality. Numbers of transsexual people in

the population are considerably smaller and difficult to estimate because many never present to clinics or request hormones through practitioners (hormones are easily acquired over the Internet without medical monitoring), and many others reject maxillofacial and genital surgery. The sex ratio of transsexual people presenting for genital surgery in the U.S. has shifted from 1:1 during the late 1960s to almost 2:1 male to female currently. It is estimated that fewer than approximately 1 in 20,000 is transsexual in the U.S.

[Transsexualism can be considered a neuro-developmental condition of the brain. Several sexually dimorphic nuclei have been found in the hypothalamic area of the brain (Allen & Gorski 1990; Swaab et al. 2001). In human males, by early adulthood, the volume of the sexually dimorphic limbic nucleus (BSTc) is almost twice as large as in females and its number of neurons is almost double ( $p < 0.006$ ) (Zhou et al. 1995; Kruijver et al. 2000; Chung et al. 2002). Further, in transsexualism this nucleus has a sex-reversed structure. In 42 human brains examined, the BSTc had a structure concordant with the psychological identification as male or female, inferring BSTc is an important part of a sexually dimorphic neural circuit, and that it is involved in the development of gender identity (Kruijver et al. 2000). Findings were independent of sexual orientation and exogenous sex-hormone use.

[Brain sexual differentiation begins during fetal development, continues after birth (Kawata 1995; Swaab et al. 2001), and is significantly influenced by hormones (although the exact mechanism is not fully understood) at several critical periods of dimorphic development when gender identity is established—initially fetal, again around birth, and postnatal. Genetic influences may contribute to an altered hormone influence in critical early brain development (Landen 1999; Coolidge et al. 2002). Similarly, medication and environmental influences (Diamond et al. 1996; Whitten et al. 2002), and stress or trauma to the mother during pregnancy may be contributing factors (Ward et al. 2002; Swaab et al. 2002).

[Development of gender identity is usually consistent with phenotype, with small numbers of children experiencing incongruence. Adult gender-incongruent outcomes cannot be predicted with certainty. In a minority of children, regardless of phenotypical socialization and nurture, gender incongruence will persist into adulthood and manifest as transsexualism (Green 1987; Ekins 1997; Prosser 1998; Di Ceglie 2000; Ekins & King 2001; Bates 2002).

[Etiologically, an innate biological predisposition is supported by a sex-reversed BSTc in trans people, along with other studies, one example of which, indicates a higher than average correlation with left-handedness (Green & Young 2001). There is no evidence that nurturing and socialization contradictory to phenotype is causal, nor that nurture entirely consistent with phenotype can prevent it (Diamond 1996). Neither contrary socialization nor psychological or psychiatric treatments alone overcome gender conditions (Green 1999). Histories from those with anomalies of genitalia provide evidence that gender identity may resolve independently of genital configuration, even when that appearance and the assigned identity are enhanced by medical and social interventions (Imperato-McGinley 1979; Rosler & Kohn 1983; Diamond 1997; Diamond and Sigmundson 1997; Kipnis & Diamond 1998; Reiner 1999; Reiner 2000).

[Etiology and causality of gender conditions are highly complex and involve multiple factors, requiring careful diagnostic process, based largely on self-assessment, facilitated by a specialist professional. By contrast to the United States, the United Kingdom’s government—and consequently the healthcare system or medical model—does not

recognize transsexualism in diagnostic descriptions of a “mental illness” (See Lord Chancellor’s Department—government policy concerning transsexual people at: [www.lcd.gov.uk/constitution/transsex/policy.htm](http://www.lcd.gov.uk/constitution/transsex/policy.htm)).

[In the U.S., many transsexual people benefit from hormones and various surgeries realigning phenotype with gender identity, coupled with well-integrated psychosocial interventions to support the person in living and working in their social role. Treatments vary and need to be tailored to individual needs and circumstances.

#### [A Clinical View: Standard of Care

[The standard of care in evaluating an individual for any gender condition involves interviewing the patient and obtaining information from family members, friends, previous pertinent medical treatments, and other sources, if possible, with the patient’s consent. Diagnostic evaluation clinically focuses primarily on psychosexual and social development, psychiatric history, and current mental status (Wheeler 1992, 1993, 1997, 2003). No specialized tests exist that can assist with differential diagnosis. Additionally, the presence of comorbid diagnoses<sup>1</sup> need to be assessed. As my colleagues and I have written in the chapter “Gender Identity Disorders” in *Treatment of Psychiatric Disorders* (Vol. 2), edited by Glen O. Gabbard, M.D., and published by the American Psychiatric Association (Schaefer, Wheeler, Futterweit 1995), “Although histories of psychiatric treatments for substance abuse, adjustment disorders, serious suicidal thoughts, and depression are not uncommon in gender dysphoric patients, there is no evidence of a frequent occurrence of comorbidity, making comparison with estimates in the general population meaningless. Many of these disorders are defense mechanisms against the frustration, psychological pain, anxiety, and discrimination stemming from patients’ inability to live safely and comfortably in society with their condition or in their desired gender roles.”

[A clinical picture emerges when a person’s concerns and uncertainties, distress, and questions about their gender identity continue and they remain feeling conflicted.<sup>2</sup> Gender-conflicted or dissatisfied people are diagnosed as suffering from a gender-identity disorder when they meet specified criteria in one of two official diagnostic sources—*Diagnostic and Statistical Manual of Mental Disorders—Fourth Edition (DSM-IV)* or the *International Classification of Diseases-10 (ICD-10)*. For example, *DSM-IV* 302.85 Gender Identity Disorder (GID) in adolescents or adults diagnostic criteria includes: a strong and persistent cross-gender identification;<sup>3</sup> and persistent discomfort with one’s sex, or sense of inappropriateness in the gender role of that sex<sup>4</sup>; absence of physical intersex condition; and disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning.

[While a clinician can help a person to understand their symptoms and dilemmas as a gender condition, most people seeking help for Gender Identity Disorders come self-diagnosed in that they bring their diagnosis to the clinician. In

diagnostics and treatment, there are many patients seeking treatments, both psychotherapeutic and endocrinological, for *social*—rather than *genital*—sex reassignment.

[Further, the Harry Benjamin International Gender Dysphoria Association’s *Standards of Care* (original document 1977, revised publications 1978, 1979, 1980, 1981, 1985, 1990, 2001) articulate professional consensus about the psychiatric, psychological, medical, and surgical management of GID. Clinicians use these guidelines to understand the range of assistance needed for gender patients. There are five elements of clinical work: diagnostic assessment, psychotherapy, real-life experience, hormonal therapy, and surgical therapy. People with gender distress, and others (i.e., families, employers, and social institutions) may use the *Standards of Care* to better understand treatment possibilities and professional thinking. Treatment goals include learning a prolonged personal comfort with one’s gender identity and expression to maximize overall psychological well-being and self-fulfillment (Schaefer & Wheeler 2003). The *Standards of Care* are intended to provide flexible directions for treatment of GID (Wheeler 2003). Clinical departures from these guidelines are appropriate in light of a patient’s unique social, psychological, or anatomical needs, as well as the development of an experienced professional’s method of handling a common situation, or specifically because of a research protocol. Such departures should be recognized, explained to the patient, and documented, both for legal protection and for short- and long-term results.

[As my colleagues and I further point out in our medical treatment chapter for gender identity disorders (Schaefer, Wheeler, & Futterweit 1995), “one option not open to patients is the option to do *nothing* about their gender condition, because such an attitude can only have disastrous consequences. Suppression and repression causes depression and are always immobilizing and sometimes fatal. Sadly, suicide attempts are not unknown for those who live their lives immersed in feelings of helplessness and hopelessness. To ignore totally one’s gender or one’s inner awareness of it—a fundamental aspect of the human personality—is, in and of itself, a form of gender suicide.”

[*Outcome Studies for Sex-Reassignment Surgery*. Comprehensive reviews of follow-up studies on post-genitally operated individuals (Lawrence 2003; Phäfflin & Junge 1992, 1998; Wheeler & Schaefer 1997b) primarily reflect no regret and identify dissatisfaction associated with unsatisfactory physical and functional results of the surgery. Age at surgery, previous marriage or parenthood, sexual orientation, and compliance with minimal eligibility requirements for sex-reassignment surgery (with the HBGDA’s *Standards of Care*) are not associated with outcomes. There is an emerging consensus that a person’s self-reported satisfaction or regret is more meaningful than previously thought criteria, such as employment, choice of sexual partners, or utilization of healthcare services (Carroll 1999; Green & Fleming 1990; Kuiper & Cohen-Kettenis 1988; Snaith, Tarsh, & Reid 1993). (*End of update by C. C. Wheeler*)]

<sup>1</sup>Axis I psychiatric symptoms, as anxiety disorders, dissociation, schizophrenia, mood, and other psychotic disorders (e.g., paranoia), plus Axis II personality disorders, as borderline, avoidant, narcissistic, obsessive-compulsive, etc.

<sup>2</sup>Emotional struggles are known clinically as: gender issues, a gender problem, a gender concern, gender distress, gender dysphoria, gender-identity problem, cross-dressing, transvestism, transgenderism, or transsexualism. They are expressed throughout one’s lifetime—from childhood into old age—in various degrees of dissatisfaction with sexual anatomy, gender body charac-

teristics, gender roles, gender identity, as well as the perceptions of others.

<sup>3</sup>Symptoms may include a stated desire to be, frequent passing as, desire to live or be treated as, or the conviction that one has the typical feelings and reactions of, the other sex.

<sup>4</sup>Symptoms may include a preoccupation with getting rid of primary and secondary sex characteristics (e.g., request for hormones, surgery, or other procedures to physically alter sexual characteristics to simulate the other sex) or belief that he or she was born the wrong sex.

## 8. Significant Unconventional Sexual Behaviors

DAVID L. WEIS

In this section, we consider a group of “other” sexual behaviors. These include sexual coercion (rape, sexual harassment, and child sexual abuse), prostitution, pornography, paraphilias, and fetishes. As a general rule, Americans tend to view heterosexual relations between consenting adults in an ongoing relationship, such as marriage, as the norm. It is true that such sexual relations are the modal pattern in the U.S.A. (Laumann et al. 1994), as is true of every culture. However, the earlier reviews of extramarital sex, alternative lifestyles, homosexuality, and bisexuality all serve to illustrate that sizable percentages of Americans engage in sexual behavior that departs from this assumed norm. American sexologists have struggled for some time to develop acceptable terminology to describe other sexual practices. The concept of sexual orientation has allowed us to view homosexuality and bisexuality as variations in orientation. Similarly, the concepts of gender transposition and gender diversity have provided terminology for examining cross-gender behaviors.

Typically, nonmarital sexual practices have been labeled as sexual deviance or sexual variance. There are, however, at least two problems with such terms. First, no matter what the proper sociological conceptualization, these terms inevitably convey a sense of pathology, dysfunction, or abnormality to behaviors which are situationally defined. For example, consider the act of exhibitionism, exposing one’s genitals to another. When practiced in the streets, the act is defined as a crime and is quite rare. When practiced in certain business establishments, the practitioner is paid for the act and clients pay to see it; and when practiced in the privacy of one’s home with an intimate partner, it is seen as normal and healthy sexual interaction. Second, some of these behaviors are, in fact, quite common. Muehlenhard reviews evidence that shows many women are victims of sexual coercion. Several recent surveys provide evidence that nearly one quarter of Americans view pornographic videotapes each year (Davis 1990; Laumann et al. 1994). It appears that relatively small percentages of Americans participate in any one of the various fetish groups reviewed below. However, taken together and added to the forms of nonmarital sexual expression we have already reviewed, it seems clear that rather large percentages of Americans do participate in some “other” form of sexual practice.

### A. Coercive Sex

#### *Sexual Assault and Rape*

CHARLENE L. MUEHLENHARD and BARRIE J. HIGHBY  
[Updated by C. L. Muehlenhard]

*Basic Concepts.* The conceptualization of rape and the treatment of rapists and rape victims in the United States have changed substantially since the 1970s, largely because of the work of feminists. The situation is complex, however; there are many perspectives on these issues. Even the terminology related to rape is at issue. Some people use the term *sexual assault* instead of *rape* to emphasize the violent nature of the act and to place greater emphasis on the behavior of the perpetrator; recent reforms in the criminal codes of some states no longer speak of rape, but of varying degrees of sexual assault (Estrich 1987; Koss 1993a). Others, however, prefer to retain the term *rape* “to signify the outrage of this crime” (Koss 1993a, 199). Some regard rape as different and more serious than assault and contend that “to label rape as a form of assault . . . may obscure its unique indignity” (Estrich 1987, 81). There is no clear consensus in

the law, the popular media, research literature, or feminist writings. We will use the term *rape*.

Similarly, some people use the term *rape survivor* instead of *rape victim*. Each term has advantages. The term *victim* highlights the harm that rape causes. The term *survivor* has more optimistic connotations and, thus, may empower someone who has been raped; it also highlights similarities between people who have survived rape and people who have survived other life-threatening events. The term *survivor*, however, may perpetuate the stereotype that only rapes that are life-threatening—that is, that involve a great deal of extrinsic violence—are worthy of being regarded as “real rape.” Thus, we will use the term *rape victim*.

*Definitions.* Rape can generally be defined as one person’s forcing another to engage in nonconsensual sex. This general definition, however, leaves many questions unanswered (Muehlenhard et al. 1992b). What behaviors count as sex? Whom do these definitions cover? What counts as force? What counts as consent? In the United States, thinking about each of these questions has changed since the 1970s, and controversy remains.

Defining rape is complicated by the fact that there are many types of definitions. In the legal domain, the federal government and all 50 states each have their own definition. Legal definitions are written by legislatures, which are composed primarily of men; thus, these definitions are likely to be written from men’s perspectives (Estrich 1987). The definitions held by the general public are influenced by the law, the media, folk wisdom, jokes, and so forth. Some researchers base their definitions on legal definitions, which makes them subject to the same biases as legal definitions; others make conscious decisions to deviate from legal definitions, which they find biased or inadequate. Finally, there are political definitions, written by activists wanting to make various political points. For example, MacKinnon (1987, 82) wrote,

Politically, I call it rape whenever a woman has sex and feels violated. You might think that’s too broad. I’m not talking about sending all of you men to jail for that. I’m talking about attempting to change the nature of the relations between women and men by having women ask ourselves, “Did I feel violated?”

Persons who regard legal definitions as the most valid criticize such political definitions as being too broad (e.g., Farrell 1993). Based on the assumption that language is power, however, political activists have resisted the status quo by challenging widely held definitions and encouraging people to think about the assumptions behind these definitions.

Prior to the 1970s, definitions of rape often included only penile-vaginal sexual intercourse. This definition has been criticized as too phallogentric, promoting the ideas that an act must involve a man’s penis and must have the potential for reproduction to count as “real sex” (Muehlenhard et al. 1992b; Rotkin 1972/1986). Currently, most definitions of rape use a broader conceptualization of sex, including many kinds of sexual penetration (e.g., penile-vaginal intercourse, fellatio, cunnilingus, anal intercourse, or penetration of the genitals or rectum by an object). Some definitions are even broader, including behaviors such as touching someone’s genitals, breasts, or buttocks (Estrich 1987; Koss 1993a).

Another contentious question involves whom these definitions cover. If rape is defined as forced penile-vaginal intercourse, then by definition, an act of rape must involve a woman and a man; this definition would exclude coercive sex between two individuals of the same gender. Defini-

tions that are limited to situations in which the perpetrator penetrates the victim exclude situations in which a woman forces a man to engage in penile-vaginal intercourse, because such situations would involve the victim penetrating the perpetrator (Koss 1993a). Some definitions of rape include only the experiences of adolescents and adults (e.g., Koss et al. 1987), whereas others also include the experiences of children (e.g., Russell 1984).

Prior to the 1970s, rape laws in the U.S. included a "marital exclusion," exempting husbands from being charged with raping their wives. By the mid-1990s, this marital exclusion had been removed from the laws of all 50 states, as well as from federal law (X 1994). In some states, however, laws still define rape between spouses more narrowly than rape between nonspouses, giving married women less legal protection than unmarried women. Furthermore, some state laws still treat rape less seriously if it occurs between two people who have previously engaged in consensual sex (X 1994).

Yet another contentious question involves what counts as force. Most definitions include physical force and threats of physical force. Many also include sex with someone who is unable to consent because of being intoxicated, asleep, or otherwise unable to consent. There is disagreement, however, regarding how intoxicated one needs to be, whether the alcohol or drugs need to be administered to the victim by the perpetrator, what happens if both persons are intoxicated, and so forth. This is particularly relevant in cases of date or acquaintance rape (Muehlenhard et al. 1992b).

Even regarding threats of physical force, there is disagreement about how direct such threats need to be. For example, in some court cases, appellate judges have written that a woman's acquiescing to sex with a man because she is afraid that he will harm her (e.g., because he has harmed her in the past, or because they are in an isolated location and he is behaving in a way she regards as threatening) is not sufficient to define the incident as rape. Instead, as Estrich commented, these judges interpreted the law to mean that a woman should not cry and give in; she should fight like a "real man" (1987, 65).

*Conceptualizations of Rape and Rapists.* Prior to the changes initiated by feminists in the 1970s, rape was commonly conceptualized as a sexual act in which a man responded to a woman's sexual provocations. Rapists were often assumed to be either black men who raped white women or else men who were lower class or crazy and who were provoked by women who dressed or behaved too provocatively (Davis 1981; Donat & D'Emilio 1992; Gise & Paddison 1988; LaFree 1982; Mio & Foster 1991). Amir (1971, 273), for example, discussed "victim precipitated rape," which he conceptualized as rape incited by female victims who spoke, dressed, or behaved too provocatively (e.g., who went to a man's residence or who attended "a picnic where alcohol is present"). MacDonald (1971, 311) wrote that

the woman who accepts a ride home from a stranger, picks up a hitchhiker, sunbathes alone or works in the garden in a two-piece bathing suit which exposes rather than conceals her anatomy invites rape. The woman who by immodest dress, suggestive remarks or behavior flaunts her sexuality should not be surprised if she is attacked sexually. These ladies are referred to as "rape bait" by police officers.

Female victims were often thought to have desired or enjoyed the experience (Gise & Paddison 1988; Griffin 1971; Mio & Foster 1991; Muehlenhard et al. 1992a). For example, Wille (1961, 19) wrote about the typical rape victim's "unconscious desires to be the victim of a sexual as-

sault." Husbands, in effect, "owned" their wives and were entitled to their sexuality; thus, the concept of marital rape was nonexistent (Clark & Lewis 1977; Donat & D'Emilio 1992). Sexual acts that occurred between acquaintances or on dates were often assumed to be sexual encounters that the woman had let get out of hand (e.g., Amir 1971).

In the 1970s, feminist writers began to conceptualize rape as violence (e.g., Brownmiller 1975; Griffin 1971). In a classic article, Griffin (1971, 312) wrote that

rape is an act of aggression in which the victim is denied her self-determination. It is an act of violence which, if not actually followed by beatings or murder, nevertheless always carries with it the threat of death. And finally, rape is a form of mass terrorism, for the victims of rape are chosen indiscriminately.

Griffin also emphasized that the fear of rape limits women's freedom, and as such, rape functions as do other forms of violence. Conceptualizing rape as violence has numerous advantages: acknowledging the serious consequences of rape; highlighting the similarities between the effects of rape and the effects of other kinds of violence; taking the emphasis of rape prevention off restricting women's sexual behavior; and acknowledging that rape affects all women, even those who have not actually been raped, by instilling fear and, thus, restricting women's freedom.

Currently, in the United States, it is common to hear people say, "Rape isn't sex; it's violence." Nevertheless, many writers, including both feminist political activists and researchers, have found value in conceptualizing rape as having elements of sex as well as violence (Muehlenhard et al. 1996). Feminists have discussed similarities between rape and other sexual situations which may also be coercive:

So long as we say that [rape involves] *abuses of violence, not sex*, we fail to criticize what has been made of sex, what has been done to us through sex, because we leave the line between rape and intercourse . . . right where it is. (MacKinnon 1987, 87, emphasis in original)

Our understanding of rapists has been enhanced by investigating both the sexual and the violent aspects of their behavior and attitudes. Rapists are more likely than nonrapists to become sexually aroused by depictions of sexual violence, as well as to feel hostile toward women, to accept rape myths and violence against women, and to view heterosexual relationships as adversarial. They drink more heavily and are more likely to have drinking problems, which may serve as a release or an excuse for sexually violent behavior. They are also more likely to have witnessed parental abuse or to have been physically or sexually abused in their childhoods. They begin having sexual experiences, either consensual or nonconsensual, earlier than nonrapists (Berkowitz 1992; Burt 1991; Koss & Dinero 1988; Finkelhor & Yllo 1985; Malamuth 1986; Russell 1982/1990).

[Update 2003: Recent research has supported and extended knowledge about sexually aggressive men. Analyzing a sample of U.S. college men, Abbey et al. (2001) found that 33% reported engaging in some form of sexual assault. Compared with other men, those who had engaged in sexual assault had more-hostile attitudes toward women, were more accepting of verbally pressuring a woman to have sex, described their friends as more approving of forced sex, and had greater expectancies that alcohol increased men's sex drive. There were also differences in their descriptions of their consensual sexual experiences: Compared with other men, the sexually assaultive men reported having had sex at a younger age, having had more partners, and drinking more prior to sex. Numerous other studies have also found

high levels of alcohol use among sexually aggressive men (Testa 2002).

[A meta-analysis by Murnen et al. (2002) found support linking men's sexual aggression to their masculine ideology. The two largest effect sizes were for Malamuth's construct of "hostile masculinity" (which includes a desire to dominate and control women and a distrustful, defensive, and insecure orientation toward women; Malamuth et al. 1991), and for Mosher's construct of "hypermasculinity" (in which men regard violence as manly, consider danger to be exciting, and have calloused attitudes toward women; Mosher & Sirkin 1984). (*End of update by C. L. Muehlenhard*)]

Research has also dispelled myths about rape. Rapists represent all ethnic groups and social classes (Russell 1984, 1990), and the overwhelming majority of rapes occur between acquaintances (Kilpatrick et al. 1987; Koss et al. 1988; Russell 1984) and between members of the same race or ethnicity (Amir 1971; O'Brien 1987). Research shows that men can be raped and women can be rapists (Brand & Kidd 1986; Muehlenhard 1998; Muehlenhard & Cook 1988; Sarrel & Masters 1982; Struckman-Johnson et al. 2003; Waterman et al. 1989). Still, because rape and the fear of rape affects women more than men, and because of the differences in how women's and men's sexuality is conceptualized in the United States, some claim it would be a mistake to treat rape as a gender-neutral phenomenon (MacKinnon 1990; Rush 1990). Finally, "thanks to the feminist movement, no one any longer defends the dangerous claim that rape is a sexually arousing or sought-after experience on the part of the victim" (Palmer 1988, 514).

*Prevalence.* How prevalent is rape? Estimates of prevalence depend not only on how rape is defined, but also on the methodology used. Conducting interviews in the presence of family members yields lower prevalence estimates than conducting interviews in private or using anonymous surveys, which is understandable given that many rape victims do not tell their families about having been raped, and some rape victims have been raped by family members (Koss 1993a; Koss et al. 1988; Russell 1984). Asking respondents if they have been "raped" yields lower prevalence estimates than asking if they have had an experience that meets the researchers' definition of rape, because many rape victims do not label their experience as "rape" (Kahn & Andreoli Mathie 2000; Peterson & Muehlenhard 2003). Asking respondents a single question about their experiences generally yields lower estimates than does asking multiple questions, perhaps because asking only one such question fails to elicit memories of rapes that may have occurred in numerous contexts (e.g., with strangers, casual acquaintances, dates, or family members, obtained by force or threats of force or when the victim was unable to consent, and so forth; Koss 1993a). [*Updates added by C. L. Muehlenhard, 2003*]

Until recently, statistical reports on the prevalence of rape published by the U.S. government were inadequate: The *Uniform Crime Reports*, published by the Federal Bureau of Investigation (FBI 1993), include only rapes that were reported to the police—a small minority of all rapes (Russell 1984). The *National Crime Victimization Surveys (NCVS)*, conducted by the government's Bureau of Justice Statistics (BJS), also have serious methodological flaws (BJS 1993; Koss 1992; Russell 1984). [*Update 2003: Some of these flaws have subsequently been addressed (e.g., in the past, NCVS reports concluded that rape was rare, despite the fact that respondents had been asked no questions about rape; see Russell 1984). Other flaws remain, however (e.g., the interviews are not necessarily confidential, and family*

members and others are sometimes present during the interviews; Tjaden & Thoennes 2000).

[Recently, the National Violence Against Women (NVAW) Survey, cosponsored by the National Institute of Justice and the Centers for Disease Control and Prevention, has corrected many of these problems (Tjaden & Thoennes 2000). The data from this national telephone survey came from 8,000 women and 8,000 men, selected from the 50 U.S. states and the District of Columbia by random-digit dialing. The NVAW included questions about forcible rape, physical assault, and stalking. Rape was defined as "forced vaginal, oral, and anal sex" (Tjaden & Thoennes 2000, 13). Respondents were asked multiple questions about experiences they had had that met the researchers' definition of rape. Respondents were asked about both completed and attempted rape (in this summary of the NVAW data, the term *rape* refers to both completed and attempted rape).

[NVAW results showed that of the women surveyed, 17.6% reported having been raped (14.8% reported completed rape and an additional 2.8% reported attempted rape). Of the men surveyed, 3.0% reported having been raped (2.1% reported completed rape and an additional 0.9% reported attempted rape). Many of the rape victims reported being raped more than once (Tjaden & Thoennes 2000).

[Among those who reported being raped, 21.6% of the women and 48.0% of the men experienced their first rape before age 12, and 32.4% of the women and 23.0% of the men experienced their first rape between ages 12 and 17. Therefore, 54.0% of the female rape victims and 71.0% of the male rape victims experienced their first rape when they were children or adolescents. Among all respondents, 9.6% of the women and 0.9% of the men reported having been raped as adults (Tjaden & Thoennes 2000).

[In the NVAW Survey, more American Indian/Alaska Native women (34.1%) than white women (17.7%), African-American women (18.8%), and mixed-race women (24.4%) reported having been raped. More non-Hispanic women (18.4%) than Hispanic women (14.6%) reported having been raped. (Statistical comparisons among racial and ethnic groups did not include men or Asian/Pacific Islander women because of limitations with the data.)

[Consistent with previous findings, the NVAW Survey revealed that women are especially at risk from current and former intimate partners; 7.7% of the women and 0.3% of the men in the sample reported having been raped by a current or former intimate partner (spouse, cohabiting partner, boyfriend/girlfriend, or date). The rape victims were asked about their most recent rape: Among the female rape victims, 61.9% were raped by a current or former intimate partner; 6.5% were raped by a relative; 21.3% were raped by another acquaintance; and 16.7% were raped by a stranger. (Data for male rape victims were insufficient to calculate reliable percentages.) (*End of update by C. L. Muehlenhard*)]

*Consequences for Rape Victims.* Research in the U.S. on the consequences of rape has improved dramatically in the past several decades. Prior to the 1970s, studies of rape victims consisted of occasional case studies of victims who sought psychotherapy, a biased sample because most rape victims do not seek therapy, and those who do are likely to be atypical (e.g., to be in greater distress, to be of higher socioeconomic status, etc.). The next generation of studies involved assessing rape victims who reported the rapes to police or emergency-room personnel; this practice allowed longitudinal assessment of the aftermath of rape, but the samples were still biased because most rapes are never reported. Currently, the consequences of rape are often studied by surveying random samples of people; this practice allows

comparisons of rape victims with nonvictims, regardless of whether the rape victims had reported the rapes to authorities or had labeled their experiences as rape. Some researchers even conduct prospective studies, in which members of a high-risk group (e.g., first-year college students) are assessed annually; if someone in the sample is raped during the time span of the study, their pre- and postrape adjustment can be compared (e.g., Humphrey & White 2000).

Research shows that most rape victims experience psychological, physical, and sexual problems after being raped. It is important to remember, however, that not all rape victims experience all of these consequences; some experience many consequences, whereas others experience relatively few consequences.

The psychological consequences of rape can include depression; fear; anxiety; anger; problems with self-esteem and social adjustment; feeling betrayed, humiliated, or guilty; and experiencing problems with trust (Lystad 1982; Muehlenhard et al. 1991; Resick 1993; Resick & Nishith 1997). Recently, some of these psychological consequences have been conceptualized as post-traumatic stress disorder (PTSD) (American Psychiatric Association 1994). This symptom constellation includes reexperiencing the rape (such as in dreams or flashbacks), feeling numb and avoiding reminders of the rape, and experiencing hyperarousal (such as insomnia, difficulty concentrating, outbursts of anger, or an exaggerated startle response; see Herman 1992; Resnick et al. 1993).

[*Update 2003*: Although it is likely that being raped causes these psychological problems, it is possible that in some cases these psychological problems increase individuals' vulnerability to rape. For example, in a longitudinal study of college women's experiences with sexual coercion, women who reported being verbally sexually coerced during the semester had lower self-esteem scores than did other women at the beginning of the semester, suggesting that low self-esteem left the women vulnerable to verbal sexual coercion (Jones & Muehlenhard 1994). Thus, research that finds differences between rape victims and nonvictims must be interpreted cautiously. (*End of update by C. L. Muehlenhard*)]

Sexual problems resulting from rape can include avoidance of sex, decreased sexual satisfaction, sexual dysfunctions, and flashbacks to the rape during sex (Kilpatrick et al. 1987; Lystad 1982; Warshaw 1988). Some rape victims engage in sex indiscriminately in ways that they do not feel good about, perhaps because the rape made them feel devalued, as if "they now have nothing left that's worth protecting" (Warshaw 1988, 74).

[*Update 2003*: Paradoxically, one consequence of sexual victimization seems to be further sexual victimization. Numerous studies have shown evidence that women who experienced child sexual abuse are more likely than others to be sexually victimized as adolescents or adults (see Muehlenhard et al. 1998 for a review). Some studies have also found this for men (Brenner & Muehlenhard 1995). NVAW data replicated this pattern: Among women who reported having been raped before age 18, 18.3% reported having been raped again as an adult; among women who did not report having been raped before age 18, only 8.7% reported having been raped as an adult (Tjaden & Thoennes 2000). In a longitudinal study of U.S. college women, Humphrey and White (2000) found that sexual victimization during childhood (before age 14) predicted an increased risk of sexual victimization as an adolescent (from age 14 until the beginning of the college); in turn, sexual victimization during adolescence predicted an increased risk of sexual victimization during college. As with studies comparing the psychological

characteristics of rape victims and nonvictims, studies comparing the subsequent victimization rates of these groups must also be interpreted cautiously: It could be the case that earlier victimization increases the risk of later victimization, but it could also be the case that personality, family, or environmental factors increase some individuals' risk as a child, as an adolescent, and as an adult.

[Numerous studies suggest that being raped leads to behavior changes. For example, as mentioned above, after being raped, some rape victims avoid sex, and others engage in sex indiscriminately. Brener et al. (1999) found that women who had been raped were significantly more likely than other women to engage in numerous health-risk behaviors. Analyzing data from a nationally representative sample of U.S. college students, they found that 20% of the women and 4% of the men reported having been raped, defined as having been forced to engage in sexual intercourse against their will. Multivariate analyses, controlling for age, parents' education, race, and sorority membership, found that women who had been raped were more likely than other women to report having thought seriously about suicide during the prior year; fighting physically with a boyfriend or spouse during the prior year; smoking cigarettes, drinking heavily, driving after drinking alcohol, and using marijuana during the prior month; having had two or more sexual partners during the prior three months; having used alcohol or drugs during their last sexual intercourse; and having had sexual intercourse before age 15. It could be the case that being raped increases the likelihood that women will engage in these health-risk behaviors; however, it could also be the case that engaging in these behaviors increases women's vulnerability to rape or that other factors increase the likelihood of these behaviors and of rape. (*End of update by C. L. Muehlenhard*)]

The physical consequences of rape can include physical injuries (including injuries from weapons or fists, as well as vaginal or anal injuries), sexually transmitted diseases, pregnancy, reproductive problems causing infertility, and psychosomatic problems (Koss 1993b; Resick 1993; Resick & Nishith 1997; Warshaw 1988).

[*Update 2003*: In the NVAW study (Tjaden & Thoennes 2000), among those who reported having been raped as an adult (age 18 and older), 31.5% of the female rape victims and 16.1% of the male rape victims reported having been physically injured during their most recent rape. These injuries ranged from bruises and sore muscles to broken bones, chipped teeth, and knife wounds. Of the women injured during a rape, 35.6% reported receiving medical treatment for their injuries. (*End of update by C. L. Muehlenhard*)]

Divulging the rape to someone else may result in various problems: feeling embarrassed or uncomfortable; reliving aspects of the experience; being disbelieved or blamed; and being questioned about one's behavior and dress, which might lead victims to feel as if they are "on trial," and needing to prove their innocence to others. When rape victims report the rape to the police, their report may be disbelieved or trivialized, although police attitudes and sensitivity have improved during the last several decades. Should the case go to trial, recent "rape shield laws" generally prohibit defense attorneys from inquiring about the victim's sexual past; nevertheless, defense attorneys typically try to discredit victims (Allison & Wrightsman 1993; Estrich 1987; Gelles 1977; Griffin 1971; Roth & Lebowitz 1988).

Contrary to stereotypes, acquaintance or date rape is as traumatic as stranger rape. Victims of acquaintance rape are as likely as victims of stranger rape to experience depression, anxiety, problems with relationships, problems with sex, and thoughts of suicide (Koss et al. 1988). Women who are raped by acquaintances they had trusted may doubt their

ability to evaluate the character of others and may be reluctant to trust others. Women raped by acquaintances are less likely than women raped by strangers to be believed and supported by others. If the victim and rapist have mutual friends, the friends may be reluctant to believe that a friend of theirs could be a rapist; they may thus be reluctant to take the victim's side against the perpetrator, and the victim may feel unsupported. If the rapist goes to the same school, workplace, or social functions as the victim, the victim may feel uncomfortable and withdraw from these activities (Kilpatrick et al. 1987; Koss et al. 1988; Russell 1982/1990; Stacy et al. 1992; Warshaw 1988).

[*Update 2003*: NVAW data (Tjaden & Thoennes 2000) revealed that rape by current or former intimate partners was especially dangerous for women: 36.2% of women raped by intimates, compared with 23.6% of women raped by nonintimates, were physically injured. In a multivariate analysis, in which other explanatory variables were held constant, women raped by intimates were 2.2 times more likely to be injured than women raped by nonintimates. (*End of update by C. L. Muehlenhard*)]

People raped by their spouses or cohabiting partners may experience consequences that other rape victims do not experience. Whereas stranger rape is typically a one-time occurrence, the rape of wives and other partners is likely to occur repeatedly and may last for years (Russell 1982/1990). Many also experience other forms of domestic violence. Victims raped by a spouse or cohabiting partner must decide either to live with the perpetrator and risk subsequent rapes or to divorce or separate, which requires many lifestyle adjustments, and which does not guarantee that they will not be raped by their ex-spouse or ex-partner (Koss et al. 1988; Lystad 1982; Russell 1982/1990). The consequences may also extend to children living in the household (Mio & Foster 1991). Children may be aware of the problem and may even witness the rapes. They may fear the parent or stepparent who is the perpetrator and may develop negative views of sex and relationships.

Boys and men who have been raped experience many of the same consequences that girls and women do, although being a male victim may result in additional consequences that female victims do not encounter. Being forced into submission is incongruous with the male sex-role stereotype that espouses control and dominance. Males raped by females often confront beliefs that they must have desired and enjoyed the act and that male victims are less traumatized than are female victims. Males raped by other males, regardless of their sexual orientation, often confront homophobic attitudes. Males also confront the myth—held by others and sometimes by the victims themselves—that if they had an erection, they must have wanted sex (Groth & Burgess 1980; Russell 1984; Sarrel & Masters 1982; Smith et al. 1988; Warshaw 1988).

Lesbian and gay rape victims may encounter difficulty in attempting to obtain services from crisis-intervention and social-service centers, as many of these agencies are not prepared to serve lesbian and gay clients (Renzetti 1996; Waterman et al. 1989). Obtaining services may require that gay or lesbian rape victims “come out,” revealing their sexual orientation and risking possible discrimination, possibly even losing their jobs, housing, or children should others find out (legal protection of lesbians and gays in the United States varies from city to city and state to state; in most of the U.S., there is no such protection). If rape occurs in a lesbian or gay relationship in which the perpetrator is the biological parent of the children, if the victimized partner leaves the relationship, she or he will probably have to leave the children with the perpetrator. Furthermore, the

gay and lesbian community is often tight-knit, so lesbian or gay rape victims may be reluctant to tell mutual friends or to participate in the community's social functions (Grover 1990; Muehlenhard et al. 1991).

*Punishment of Rapists.* The typical punishment for rapists is no penalty, given that most rapes are not reported to the police (Koss et al. 1988; Russell 1984). Even those that are reported rarely result in arrest and conviction (Allison & Wrightsman 1993). Among those who are convicted of rape, punishment varies from merely being placed on parole to life in prison.

Until the 1970s, the penalty for rape included the death penalty; 89% of the men executed for rape in the United States from 1930 to 1967 were African-American (Estrich 1987, 107). In 1977, the U.S. Supreme Court found the death penalty for rape to be unconstitutional (*Coker v. Georgia*, 433 U.S. 584, 1977; see Estrich 1987). Studies of actual sentences given to convicted rapists reveal that the harshest penalties for rape are still imposed on African-American men convicted of raping white women (Estrich 1987; LaFree 1980). There is also a bias against convicting affluent, successful men and men who rape women they know or who rape women who do not conform to cultural expectations of how a “good woman” should behave (Estrich 1987; LaFree et al. 1985).

*Prevention.* Prior to the 1970s, rape prevention was generally regarded as women's responsibility. Because rape was regarded as an act of sex incited by provocative women, rape prevention consisted largely of expecting women to restrict their behavior (expecting women not to talk or dress provocatively, not to go out at night, etc.).

Currently, a variety of prevention strategies are common in the U.S. (Muehlenhard et al. 1992a). Some people still urge women to restrict their behavior, and research shows that women do indeed restrict their behavior because of the fear of rape: Women report avoiding going outside alone at night, not talking to strangers, wearing bulky clothing, having unlisted phone numbers, and so on (Gordon & Riger 1989; Hickman & Muehlenhard 1997). These precautions limit women's freedom and diminish women's quality of life. [*Update 2003*: Furthermore, this approach focuses on stranger rape; paradoxically, although stranger rape accounts for a minority of all rapes (Tjaden & Thoennes 2000), women fear stranger rape more than acquaintance rape and take more precautions to avoid stranger rape than acquaintance rape (Hickman & Muehlenhard 1997; Pain 1997; Poirier & Muehlenhard 2000). (*End of update by C. L. Muehlenhard*)]

There are other prevention strategies that are not predicated on women's restricting their behavior. For instance, many universities have installed extra lighting and emergency telephones (often marked by blue lights) to help women feel safer. These strategies are aimed primarily at preventing stranger rape, however, and will not help women who are raped indoors by husbands, partners, dates, or other acquaintances. To address these problems, many universities have initiated lectures and workshops presented to college dormitory residents, fraternities, sororities, and athletic groups; some high schools and even junior high schools have also initiated such programs, although they sometimes meet resistance from parents and school boards (Donat & D'Emilio 1992). There is evidence that such programs can lead to attitude change (Jones & Muehlenhard 1990), although the effectiveness of these strategies in actually preventing rape is unknown.

Some women take self-defense classes. For example, Model Mugging programs teach women self-defense strate-

gies that utilize women's physical strengths, such as lower-body strength (Allison & Wrightsman 1993). Research shows that active-resistance strategies (e.g., physically fighting, screaming, and running away) are generally more effective than the passive-resistance strategies (e.g., pleading, crying, reasoning, or doing nothing), and active strategies do not increase the risk of physical harm (Bart & O'Brien 1984; Ullman 1997; Ullman & Knight 1992; Zouha-Jensen & Coyne 1993). Unfortunately, no strategy is effective all of the time or for all people, and even experiencing an attempted rape can be traumatic. Furthermore, many feminist theorists have argued that, because most rapists are men, it is unfair to place the burden of rape prevention on women (Berkowitz 1992; Koss 1993b).

The most important strategies for preventing rape involve working for broader social change: changing men's and women's attitudes about rape, sex, and gender roles; working toward gender equality; discouraging violence as a problem-solving technique; and emphasizing that coercive sex in any context, whether with a stranger or acquaintance, is never acceptable.

[*Sexual Rape in the Military* ROBERT T. FRANCOEUR

[*Update 2003*: In the early 1990s, Americans became very aware of "sexual harassment" when several women charged Senator Bob Packwood with sexual harassment; when, in Congressional hearings to confirm Clarence Thomas as an associate justice of the U.S. Supreme Court, Anita Hill claimed that she had been a victim of repeated sexual harassment by Thomas; and when women officers attending the annual Tailhook Convention of the U.S. Navy made public charges of sexual harassment and assault against male officers. Three admirals were issued letters of censure, but as one woman officer later reported, "not a single Naval officer who took part in Tailhook got anything more than a slap on the wrist."

[The Tailhook scandal eventually left the headlines, but it erupted again in 2003 at the Air Force Academy in Colorado Springs, when women cadets took their charges to the press and television news reporters, finally forcing a Congressional hearing and three independent military investigations of the top command at the Academy. With close to 800 women in the 4,200-member Cadet Corp, the command admitted to processing 56 cases of rape in the previous 10 years, and expelling only eight male cadets and court-martalling only one cadet, who was acquitted. As one female cadet commented: "They tell you to expect getting raped, and if it doesn't happen to you, you're one of the rare ones. They say if you want a chance to stay here, if you want to graduate, you don't tell. You just deal with it."

[Attempts of the Pentagon to deal with the emerging scandal failed in mid 2003 when the General appointed in 1991 to solve the problem was forced to resign along with the four top officers in March 2003. Congressional hearings and three independent military investigations were initiated, with reports that rapists had routinely used the General's disciplinary crackdown on minor infractions as a shield to intimidate victims and thwart their efforts to seek prosecution. In effect, the commander set a tone to blame the victim, which in turn discouraged women cadets from lodging formal complaints for fear of retribution against themselves or classmates who could serve as witnesses. It was soon documented that claims of sexual assault were rarely investigated or seldom severely punished.

[In August 2003, the Air Force general counsel issued a report based on her five-month investigation that substantiated many of claims made in a 1996 report to the Air Force, the inspector general, and the Senate Armed Services Com-

mittee. Air Force records showed at least 30 sexual assaults were reported to Academy officials since the report was given to the Air Force Chief of Staff in 1996 and passed on in 2000 to the Senate Armed Forces committee. The 2003 report confirmed allegations that were known to the highest-level officials in the Pentagon and Congress, namely that:

- The Air Force Academy maintained "a culture of silence and intimidation" that stigmatized women who came forward. This culture, filtered down from the highest levels of command, placed the institution and peers above personal integrity.
- The reporting consisted of a fractured composite of agencies, functioning separately, but there was no formal program to help victims.
- No one had ultimate responsibility for investigating and dealing with incidents.
- Sixteen cases of assault spanning several years included one woman so traumatized she slept with a weapon; another woman raped at the Academy's prep school, who was so ostracized for reporting the attack, she didn't report a subsequent gang rape; another who suffered a cut vagina in an attack but didn't report it until she experienced "noticeable" blood loss; and others who were left to "suffer silently in shame."
- The school "reflects institutional/cultural dysfunction" that officials should confront.

[On August 28, the office of the Department of Defense inspector general released the results of a survey of female cadets that showed that the problem in the Air Force Academy has been much more common than originally suspected, with 12%, one-in-six female cadets, reporting being raped or the victim of an attempted rape. Since 10% of the female cadets declined to answer the survey, the inspector general concluded that the true extent of the problem is probably much higher than 12% (Janofsky 2003; Moss 2003; Schemo 2003a, 2003b; Zubeck 2003). (*End of update by R. T. Francoeur*)]

### *Child Sexual Abuse and Incest*

DIANE BAKER and SHARON E. KING

Knowledge of child sexual abuse (CSA) has undergone cycles of awareness and suppression, as both professionals and the general public have struggled to come to terms with its existence since child sexual abuse first gained widespread attention in the 1890s, when Freud proposed that it was at the root of hysterical neurosis. Although modern clinical work tends to confirm the link between child sexual abuse and various neuroses, Freud quietly abandoned his early belief in response to the strong opposition from Victorian attitudes of that era. Linking neuroses with repressed childhood sexual conflict, Freud's Oedipal and Electra complexes, was revolutionary, but at least much more acceptable than admitting the reality and prevalence of child sexual abuse.

During the past 20 years, child sexual abuse has received renewed attention from American clinicians, researchers, and the general public. Recently, child sexual abuse has been the focus of a substantial amount of American research that has, in turn, led to broader recognition of the initial and long-term problems associated with child sexual abuse.

*Definitions.* The definition presented by the National Center on Child Abuse and Neglect is "Contact and interactions between a child and an adult when the child is being used for the sexual stimulation of the perpetrator or another person." This definition is problematic, however, in that it leaves key

terms open to question. For example, in considering who is a child, researchers have employed cutoff ages anywhere between 12 and 17 years for victims of child sexual abuse. In deciding who is an adult, some researchers have required perpetrators to be at least 16 years of age; others have required age differences between victim and perpetrator of five years or ten years; still others have not required any age difference at all if force or coercion was used. In determining what is sexual stimulation, some authors include non-contact experiences, such as exhibitionism or propositioning, whereas others require manual contact, and still others, genital contact. In a 1987 study designed to determine the effect of varying the operational definition of child sexual abuse on its prevalence, the percentage of college men identified as victims ranged from 24% to 4% based on how restrictive the criteria used were. The parameters defining child sexual abuse, therefore, will have strong implications for how widespread a problem society considers it.

A second major issue is determining, in the absence of physical injury, what has been damaged. This issue is complicated by a consistently identified minority of victims who report such experiences as having been positive. Some authors have pointed to this subset and wondered whether the abuse was against the individual or societal values, and further, whether in defining child sexual abuse, consideration should be given to the victim's view of the experience as negative or positive. Yet, a victim's view of a child sexual abuse experience as positive does not preclude the possibility that it was a harmful or damaging one.

A cogent argument against using the victim's assessment of the experience as positive or negative in defining abuse is that the inequalities of knowledge, sophistication, and power inherent in any child-adult relationship prevent the child from giving informed consent to engage in sexual behavior. From this perspective, it is the emotional and intellectual immaturity of the child that causes the developmentally inappropriate exposure to adult sexuality to be harmful and abusive.

These issues of definition influence the composition of the groups studied by researchers and, thereby, the results obtained. As yet, there has been no completely satisfactory way to define child sexual abuse to ensure that the research results are relevant and helpful to the greatest number of people. Currently, the most widely used set of criteria for defining child sexual abuse are contact experiences between a child aged 12 or younger with an individual five or more years older, or between a child aged 13 to 16 with an individual ten or more years older. These criteria emphasize the differences in developmental maturity between the victim and perpetrator, while minimizing the inclusion of age-appropriate sexual exploration between peers as sexual abuse.

*Prevalence of Child Sexual Abuse.* Accurate estimates of the prevalence of child sexual abuse in either the general population or clinical populations have been difficult to obtain, in part because of the differences in operational definitions discussed above, in part to the sensitive nature of the topic, and in part to differing methods of assessment (e.g., questionnaire, face-to-face interview, or telephone interview). Estimates of the percentage of adult women who have experienced child sexual abuse vary from 6% to 62% and of adult men from 3% to 31%. In general, percentages are higher among clinical samples than among community-based samples. Additionally, more people disclose abuse histories when information is gathered via an interview rather than by questionnaire, when specific questions about childhood sexual experiences are asked, and when such

terms as "sexual abuse" and "molestation" are avoided (see also Prendergast 1993).

More confidence can be placed in the accuracy of prevalence rates when the samples used are large, random, and community-based. In a 1990 random sample of over 2,000 adults across the United States, 27% of women and 16% of men reported having experienced such abuse as children. In other large-scale studies, about 25% of women and 17% of college men have been identified as having histories of child sexual abuse. The majority of child sexual abuse cases are perpetrated by a nonrelative, generally an acquaintance or family friend; about 30% of girls are abused by a relative (with about 4% involving father-daughter incest), whereas about 10% of boys are abused by a relative. Finally, the prevalence of child sexual abuse does not seem to vary with social class or ethnicity (Hunter 1990).

*Theories Explaining Child Sexual Abuse.* Upon hearing of child sexual abuse, people generally react strongly, wondering how such abuse could occur. Originally, professionals held a simplistic view of child sexual abuse, considering it to be the result of the isolated actions of a depraved and flawed perpetrator. In the past several decades, however, two more-complicated theories of child sexual abuse have dominated the field.

Family systems theory posits that families function as integrated systems and that irregularities in the system are displayed through symptomatic behavior in one or more family members. From this perspective, the occurrence of incest reflects a distortion in the family system, specifically in the marital subsystem, that is being expressed through a parent's (usually the father's) sexual behavior with a child. This model proposes, then, that child sexual abuse occurs as a misguided attempt to cope with problems in the family. Treatment, therefore, involves recognition of the underlying problems and the institution of changes by all family members rather than through removal of the perpetrator.

Although less simplistic than earlier proposals, this model has been criticized for seeming to blame the victims for the abuse and by removing responsibility from the perpetrator. Additionally, the model is relevant only to incest, which is a relatively small fraction of the child sexual abuse cases.

In order to address these concerns, Finkelhor proposed a four-factor model of child sexual abuse incorporating some aspects of the family systems' perspective, but shifting responsibility for the abuse back to the perpetrator. He conceptualized child sexual abuse as resulting from an interaction between environmental circumstances and the personality of the perpetrator, rather than simply as inherent in the perpetrator or in the family system.

In this model, four preconditions must be met for child sexual abuse to occur. First, the offender must have some motivation to abuse sexually; thus, child sexual abuse satisfies some emotional or sexual need in the perpetrator that is not readily satisfied in other ways. Second, the offender must overcome his or her inhibitions against child sexual abuse. Inhibitions may be overcome in a variety of ways, such as substance use, rationalization, the influence of stressors, or personality factors (e.g., impulsivity). Third, environmental impediments to the abuse must be removed; the offender must have private access to a child. Therefore, she or he may target children who are without consistent adult supervision or obtain employment that provides contact with children. Fourth, the offender capitalizes on the lowered resistance of the child; children who are insecure, needy, uneducated about sexuality, and/or have a trusting relationship with the offender have lowered resistance.

These children are less likely to be assertive in refusing abusive overtures or to disclose immediately that the abuse took place. All of these factors, working in concert, allow child sexual abuse to occur.

Some people remain uncomfortable with the third and fourth preconditions of this model, because they appear to place some responsibility for the child sexual abuse outside the perpetrator and onto the child and his or her non-offending parent(s). Finkelhor stresses, however, that without the first and second preconditions, qualities, and behaviors of the offender alone, child sexual abuse would never occur. These preconditions place responsibility for the act squarely with the perpetrator.

*Who Is at Risk for Child Sexual Abuse?* The environmental circumstances in which boys are sexually abused versus those in which girls are sexually abused differ in some important ways. Some of these differences were highlighted by Tzeng and Schwarzin (1987), who compared the demographic characteristics of boys and girls in over 15,000 substantiated cases of sexual abuse in Illinois. They found that girls who had been sexually abused tended to live in homes that did not differ from those of the general population in the numbers and kinds of parents/caretakers present, whereas boys who had been sexually abused were significantly more likely to come from single-parent homes and/or from families with either new or many children/dependents. On the other hand, the girls' families tended to display significantly more dysfunction, and caretakers were more physically and/or mentally impaired than caretakers in the boys' families. These results are similar to those of Finkelhor, who found the risk of child sexual abuse among girls increased approximately twofold when a mother was absent from the home. These findings point to an increased risk of sexual abuse when parents are absent, impaired, or overworked (see also Prendergast 1993).

Some differences in the perpetrators of abuse of boys versus girls have also been identified. Tzeng and Schwarzin (1987) and others reported that sexual abuse of boys is more likely to be perpetrated by a stranger, whereas abuse of girls is more likely to be perpetrated by a relative. Further, when boys are abused by a relative, these relatives are more likely to be within five years of age of the boys, whereas relatives who abuse girls are more likely to be ten or more years older than the girls. Although the vast majority of perpetrators of both boys and girls are men, boys are more likely to be abused by women than are girls (17% versus 2%). Thus, for boys, child sexual abuse experiences tend to occur outside the home and to be perpetrated by a nonfamily member or, if inside the home and perpetrated by a relative, the relative is less likely to be a parent-figure or to have adult status. Girls are more likely to be abused within the home by a relative ten or more years older. Risk to girls is increased by sevenfold for girls with a stepfather. A general consensus among researchers is that more boys are somewhat more likely to experience severe abuse (actual intercourse) than are girls.

These differences suggest boys and girls may be experiencing child sexual abuse situations that require differing coping skills. Girls may, more typically, need to adjust to the notion that an adult in a position of trust has been abusive, and boys may, more typically, need to adjust to the notion that the world outside the home is not safe and may need to react to a more-severe physical experience. It should be stressed that all of these differences are generalizations, and there is substantial overlap in the nature of the child sexual abuse experiences of boys and girls.

*Initial Effects of Child Sexual Abuse.* Although researchers have identified a wide array of problems occurring among

children who have been sexually abused, most have failed to find any substantial differences in symptomatology between male and female victims. When studying these initial effects, researchers have recently begun to divide subjects into three groups based on their stage of development: preschool (ages 3 to 6), school age (ages 7 to 12), and adolescent (ages 13 to 17). By using these groupings, the presence and frequency of various behaviors and symptoms can be compared to those considered developmentally appropriate for the stage.

Among both preschool boys and girls, the most frequent behavioral symptom associated with child sexual abuse experiences is an increase in sexualized behaviors (Beitchman et al. 1991). This increase has been noted in a number of studies using a variety of methodologies, including chart review, parent rating, observed play with anatomically correct dolls, and human-figure drawing. However, the prevalence of this behavior varies widely depending on the context, from 10% of the sample in the case of human-figure drawing to 90% of the sample in play with anatomically correct dolls; still, this finding is among the most robust in the literature. [*Comment 1997:* These studies do not make comparisons to groups of "normal" children and their rate of sexual behavior. (*End of comment by D. L. Weis*)]

Emotionally, preschool children are likely to respond to sexual abuse with anxiety, signs of post-traumatic stress (e.g., nightmares, vigilance, or bed wetting), and depression (Kendall-Tackett et al. 1993). These children are also likely to exhibit greater immaturity than nonabused controls, showing increases in both dependency and impulsivity relative to physically abused and nonabused age peers.

Among school-age children, researchers have focused on behavioral problems that interfere with academic and social success. Sexually abused children have been assessed by their teachers as significantly less able than their non-abused peers to learn in the school environment. This difficulty may be a function of the wide range of behavioral and emotional problems they display. For example, approximately half of the school-age girls with histories of child sexual abuse show high levels of immaturity and aggression (Kendall-Tacketts et al. 1993). Similarly, both parents and teachers rated sexually abused children as more emotionally disturbed and neurotic than their classmates, displaying both depression and a wide range of fears (Beitchman et al. 1991; Browne & Finkelhor 1986; Kendall-Tackett et al. 1993). Additionally, like preschool children, the sexually abused school-age boys and girls display clear-cut increases in sexualized behaviors, including such problems as excessive and inappropriate masturbation and sexual aggression (Browne & Finkelhor 1986; Kendall-Tackett et al. 1993). All of these symptoms would be expected to lead to problems in school for children, regardless of their intelligence.

A somewhat different presentation has been observed among adolescents with a history of sexual abuse. Although acting-out behaviors, such as running away, substance use, and sexual promiscuity were more common in these adolescents than their nonabused peers, they were less common than among clinical groups of adolescents (Beitchman et al. 1991). The predominant finding among sexually abused adolescents is an increase in depressive symptomatology, such as low self-esteem and suicidal ideation. This depression may be expressed through self-injurious behaviors, as exhibited by more than two thirds of sexually abused adolescents (Kendall-Tackett et al. 1993), or through suicide attempts made by a third of these adolescents in a clinical sample.

Although there is an extensive list of symptoms and problems associated with the initial effects of sexual abuse, it should be noted that not all children display such effects.

Indeed, 20% to 40% of sexually abused children have been found to be asymptomatic at the time of initial assessment (Kendall-Tackett et al. 1993). Unfortunately, some of these children have become symptomatic by the time of later assessments. There is fairly consistent evidence that from a third to a half of sexually abused children show improvement in symptom presentation 12 to 18 months after the abuse, although another quarter to a third show deterioration in function.

*Long-Term Effects of Child Sexual Abuse.* Although the long-term effects of child sexual abuse experiences have been studied in both men and women, the majority of the work has been done with women. Reviews of this research have been conducted by Browne and Finkelhor (1986) and Beitchman et al. (1992). The results vary somewhat, depending on whether the samples were community-based or clinically based; still, there is substantial overlap across the two populations.

In both clinical and community-based surveys of women with histories of child sexual abuse, the most common long-term effect is depression. Depression is particularly striking among the community-based samples of victims, in which significantly more women with a history of child sexual abuse report both more-severe and more-frequent episodes of depression compared to those without such experiences. Almost one in five college women reporting a history of child sexual abuse had been hospitalized for depression compared to one in 25 women who had not been abused. In a community-based study of the Los Angeles area, researchers found that a history of child sexual abuse was associated with a fourfold increase in the lifetime prevalence rate for major depression among women. Other prominent depression-related symptoms include problems with self-esteem, which appear to intensify as time elapses from the abuse, and an increased risk for self-injurious or destructive behaviors (Browne & Finkelhor 1986).

Increases in problems with anxiety occur among some women with sexual abuse histories. Problems with anxiety are more prominent among clinical samples than community samples (Beitchman et al. 1992; Brown & Finkelhor 1986). Anxiety seems to be particularly prevalent among women sexually abused by a family member and in cases in which force was used during the abuse.

Relationship difficulties are more common among women with histories of child sexual abuse compared to nonabused women. Abused women are more likely to fear intimacy and to have sexual dysfunctions, particularly when the abuse was more severe and/or was perpetrated by a father or stepfather (Beitchman et al. 1992). A history of child sexual abuse in women is also associated with an increased risk of further revictimization in the forms of rape and domestic violence.

Much less research has been conducted on the long-term effects of sexual abuse in men; much of the information available has been based on clinical case studies or extrapolated from studies with some adult male victims, but in which the majority of the subjects were women. Therefore, conclusions are much more tentative. Several community-based surveys found that men who reported child sexual abuse experiences exhibited a higher rate of psychopathology (e.g., depression, anxiety, or symptoms of post-traumatic stress) than those who did not report such experiences. Men who have been sexually abused have reported significant problems with poor self-esteem and self-concept. Men may respond to such feelings by self-medicating with alcohol and drugs, as indicated by the large degree of substance abuse and dependence among male victims; sex-

ually abused women, on the other hand, report greater levels of depression and anxiety.

Clinicians suggest that intense anger, sexual dysfunction, problems with intimacy, gender-identity confusion, and substance abuse are prominent symptoms for males with a history of child sexual abuse seeking therapy. Additionally, disclosure of sexual abuse is particularly difficult for men. Issues related to disclosure include fears of not being believed (particularly if the perpetrator was female), fears others will consider them homosexual, concerns that they are homosexual because they have been abused by a man, and issues related to masculine identity.

*Correlates of More-Severe Effects.* Although the preceding paragraphs present a grim picture of the aftereffects of child sexual abuse, not all individuals suffer such severe effects. In fact, in a given sample of abuse survivors, a quarter to a third of the individuals can be expected to appear symptom-free on the chosen assessment instruments (Kendall-Tackett et al. 1993). About one third of these asymptomatic individuals may become symptomatic at later assessments. Still, these differences in outcome have led researchers to examine variables associated with more-severe effects.

One variable consistently associated with more-severe effects is the use of force (Beitchman et al. 1992; Browne & Finkelhor 1986; Kendall-Tackett et al. 1993). This finding has been most robust in studies of the initial effects of child sexual abuse among children (Kendall-Tackett et al. 1993). A number of researchers also have identified an association between the use of force and victims' reports of the degree of trauma experienced among adult survivors as well (Beitchman et al. 1992; Browne & Finkelhor 1986). There is also some evidence that family-background variables, such as high levels of conflict and low levels of support, are related to more-severe effects. The situation is further complicated in that, for some individuals, the use of force has been associated with a decrease in self-blame, thereby reducing the severity of effects.

The relationship of the perpetrator to the victim has also been examined. Among children, the initial effects of abuse are more severe when the perpetrator has a closer relationship to the child (Kendall-Tackett et al. 1993). The situation is less clear for the long-term effects among adults. In general, whether the perpetrator was a family member has little impact on later outcome among adults (Beitchman et al. 1992; Browne & Finkelhor 1986) with one important caveat: Trauma and psychopathology effects are more severe if the abuse was perpetrated by a father or stepfather (Beitchman et al. 1992; Browne & Finkelhor 1986). This difference may represent a greater degree of family dysfunction and a more significant breach of trust when a father perpetrated the abuse (Beitchman et al. 1992). The lack of a general effect of intrafamilial versus extrafamilial abuse among adults may be a reflection that it was the quality of the relationship with the abuser (i.e., how much he was trusted) that influenced outcome rather than whether he was a relative. Finkelhor has extended this notion by proposing that the important variable is the degree to which the child was seduced and persuaded by the perpetrator, whether or not the child had a prior relationship with the perpetrator.

A third major variable examined to determine its relationship to long-term effects has been the duration of the abuse. This variable has been difficult to assess for a number of reasons. First, the criterion for child sexual abuse of long duration varies among researchers, from abuse that occurred for more than six months to abuse that occurred for more than five years. Second, as noted by Beitchman et al. (1992), researchers have tended to use very different mea-

asures, some assessing a subjective sense of harm, and others assessing a more objective degree of psychopathology. There is some evidence, however, that child sexual abuse of longer duration leads to an increase in psychopathology in community-based samples. The two major reviewers of long-term effects of child sexual abuse (Beitchman et al. 1992; Browne & Finkelhor 1986) have both concluded that more research must be conducted before firm conclusions can be drawn, whereas reviewers of initial effects have suggested that longer duration is associated with a worse outcome (Kendall-Tackett et al. 1993).

The severity of the child sexual abuse experience has also been examined in relation to psychopathology and harm in adulthood; here again, the results are mixed. There is general agreement that increased trauma and maladjustment are associated with contact abuse versus noncontact abuse, both initially and in the long term. Further, abuse involving genital contact, whether manual, oral, or invasive, is associated with more-serious outcomes than kissing or clothed contact. Researchers differ, however, in whether invasive contact as compared to manual contact is associated with increased trauma in the long term. Initially, invasive contact is associated with a worse outcome (Kendall-Tackett et al. 1993). Further research is necessary to determine the long-term effects of invasive contact.

One nonabuse-related variable, family support, has also been consistently identified as contributing significantly to both the initial and long-term effects of child sexual abuse. Kendall-Tackett et al. (1993) reviewed three studies examining the relationship of maternal support to symptom outcome in children who had been sexually abused. All three studies concluded that children whose mothers were low in support exhibited worse outcomes following the abuse. This conclusion was supported by the findings of other researchers who examined long-term coping among college women with histories of child sexual abuse.

*Theories about the Nature of the Effects.* Researchers have cataloged a multitude of symptoms associated with child sexual abuse that therapists have, in turn, attempted to address in treatment. Therapeutic treatment of any type is greatly facilitated by a theory or framework to organize and to approach symptoms. Many clinicians note that it is an impaired trust in self and others that underlies many of the symptoms associated with child sexual abuse.

This difficulty with trust has led some researchers and therapists to conceptualize the symptoms associated with child sexual abuse as a function of post-traumatic stress disorder (PTSD). This disorder encompasses some of the more-troubling symptoms experienced by sexual abuse survivors, such as depression, nightmares, and affective numbing. All of the PTSD conceptualizations of sexual abuse incorporate the idea that exposure to the abuse is experienced by the victim as overwhelming, because of intense fear and/or to extreme violations of beliefs about the way the world operates. When confronted with the abuse then, the child is unable to cope, given his or her current level of internal resources, and so must distort cognitions and/or affect in an effort to adjust to the experience. These distortions are, then, the basis for the symptoms that appear following the abuse.

However, there are some limitations to the application of PTSD to sexual abuse symptomatology. Among the most compelling of these limitations is the fact that the symptoms of PTSD do not encompass all of the problems associated with child sexual abuse. Also, many survivors do not meet the criteria for PTSD. In one group of survivors, only 10% could be diagnosed with PTSD at the time of the survey, and

only 36% could have ever been diagnosed with the disorder. Clearly, more work is needed in the conceptualization of the symptoms associated with a history of child sexual abuse.

Toward this end, Finkelhor has proposed a theory of child sexual abuse symptomatology, the Traumagenic Dynamics Model of Child Sexual Abuse (TD), which attempts to address the empirical findings more fully. The TD model emphasizes that the trauma associated with child sexual abuse may be because of the stress of the ongoing nature of the abuse situation, rather than an isolated event that is overwhelming and far removed from usual human experience (as described by the PTSD criteria in the *Diagnostic and Statistical Manual III Revised (DSM III-R)*). This differentiation does not suggest that one type of trauma is more harmful than another; it simply highlights a qualitative difference in events that may lead to different coping responses and/or symptomatology.

The TD model includes four dynamics that occur to varying degrees in any child sexual abuse situation and that are postulated to contribute to the symptoms identified in the research literature. These dynamics include: (a) Traumatic Sexualization, which occurs when the child is taught distortions about his or her sexuality, and may lead to the increase in sexual dysfunctions observed among adult survivors; (b) Betrayal, which occurs in two ways, either when the child finds that an adult she or he trusted has hurt him or her or when the child discloses the abuse to an adult who refuses to believe or help the child. Finkelhor characterized the increased depression and revictimization seen among survivors as a result of the lost trust and unmet dependency needs. It can also lead to increased anger and hostility as a mechanism of keeping others at a distance; (c) Powerlessness, which occurs in a variety of ways in the child sexual abuse situation, for example, when the child finds himself or herself incapable of physically warding off the perpetrator. Powerlessness is further manifest when the child is unable to extricate himself or herself from the abuse situation or unable to do so in a satisfactory way (e.g., without being removed from the home). This powerlessness dynamic leads to anxiety and fear in adult survivors as well as a decreased coping ability; (d) Stigmatization, which occurs either directly through the labeling of the child by others as bad or dirty following disclosure of the abuse or indirectly through the sneaking behavior of the perpetrator and the admonitions that the abuse be kept secret. Stigmatization may be associated with the low self-esteem and the self-destructive behaviors, such as substance abuse and suicide attempts, observed among survivors.

However the effects are conceptualized, recent evidence has demonstrated that child sexual abuse is prevalent and commonly results in harmful effects. Finkelhor and others have attempted to make sense of a confusing array of symptoms presented by many, but not all victims of child sexual abuse. More-sophisticated research designs (e.g., involving structural equation modeling) are required before the relationship between various experiences of child sexual abuse and outcomes become more clear.

### *Clergy Sexual Abuse*

SHARON E. KING

In the past ten years, sexual abuse of minors by clergy has become a major public scandal and crisis for all the churches, although the public attention is often focused on the Catholic clergy because of their requirement of celibacy. Until recently, charges of sexual abuse by clergy were treated as an internal problem within Church jurisdiction and not reported to police. The main issue for Church officials was to control damage to their institution's image. That silence exploded with national media coverage of the

case of James Porter, a Massachusetts priest, who victimized, often sadistically, over 200 minors in several states between 1960 and 1972, and a similar case in Louisiana. Media coverage triggered a flood of new charges of abuse. Ten of 97 priests in a southwestern diocese, nine of 110 in a midwestern diocese, seven of 91 in a southern diocese, and 15 of 220 and 40 of 279 in the eastern United States were charged in civil and criminal suits. In December 1993, 12 of 44 priests in a California minor seminary were charged with having been sexually active with 11- to 17-year-old boys between 1964 and 1987. Between 1984 and 1994, an estimated 5,000 survivors reported their abuse to Church authorities. By early 1995, over 600 cases were pending (Sipe 1995, 26-28). Meanwhile, the Catholic dioceses of Sante Fe and Chicago admitted being in danger of bankruptcy; between 1984 and 1994, Catholic officials admitted to paying out over a half billion dollars in damages to survivors (Rossetti 1991).

Sipe (1995, 26-27) estimates that, at any one time, 6% of Catholic clergy are sexually involved with minors; the situation does not appear to be as serious in Protestant and Jewish circles. One third of the cases of abuse by priests can be classified as true pedophiles, with a three-to-one preference for boys. Two thirds of the abusive priests are involved with adolescents with a more even gender distribution. Four times as many priests are involved with adult women as with minors.

"The crisis of image has been compounded by church authorities who were slow, defensive, and even duplicitous in their public response as abuse by clergy became public and other indications of trouble mounted" (Sipe 1995, 8). Even as late as 1992, fully two thirds of the American Catholic bishops were confused or unconvinced that there is a problem of sexual abuse by the clergy, although even the Pope has acknowledged the crisis.

Civil authorities have responded by extending the statutes of limitations on reporting such abuse. New laws in all states require any professional to report suspected sexual abuse of a minor; in many states, any person is required to report suspected abuse. However, such laws are often vague in defining "reasonable suspicion."

The year 1990 was a watershed as confused Church authorities began losing their damage-control efforts to the rising tide of victims' voices expressed in civil and criminal lawsuits against priests, dioceses, and religious orders. Support groups for survivors spread across the nation: Victims of Clergy Abuse LINKUP, Survivors Connections, American Coalition for Abused Awareness, and Survivors Network of Those Abused by Priests (SNAP).

In 1992, the Catholic Archdiocese of Chicago adopted a model plan for processing allegations of clergy abuse; unfortunately, it remains incompletely and unevenly implemented. In 1993, St. John's (Benedictine) Abbey and University in Collegeville, Minnesota, established an ecumenical Interfaith Institute to study this problem.

How survivors are treated by a religious community varies greatly, and survivors should be reminded that, when they set out to seek legal action against anyone, the course may be extremely difficult. Far too often, survivors feel that they are revictimized by a system that protects the abuser, rather than one that is sensitive to the trauma of the victim.

#### [Clergy Sexual Abuse—A 2003 Update

WILLIAM PRENDERGAST

[Update 2003: In discussing the present, media-sustained uproar over sexual molestation by religious personnel, which first came to the attention of investigative reporters in the 1980s, the twofold emphasis has been on Catholic

priests and cases of molestation of children. The problem of clerical abuse is far greater and includes religious personnel from all religions: Catholic priests and brothers, Protestant ministers of many denominations, Jewish rabbis, and recently, Muslim imams. It also encompasses the sexual molestation of adult women and men, the fathering of children who are then abandoned, and even drug-involved sexual molestation.

[An extremely important element found in a majority of these cases is a religious one. Quite often the molester informs the victim that God has given him permission to use the body of the victim in any way he pleases and, secondly, that God will protect him from all harm should the victim tell his parents, the police, and so on. The element of "threat(s)" made by these molesters includes personal threats to the victim, as well as threats against his or her family members and religious threats ("God will punish you if you tell!"). Since this group of molesters, like the pedophile or hebophile groups in other molestations, carefully chooses inadequate, timid, easily impressed, and passive types to molest, these pronouncements are believed and contribute to long-lasting guilt in the victims that is especially difficult to treat. Parents and other adults in their close-to-idolization of religious personnel contribute to the damage done to these victims by not believing anything the victim reports, proving the "protection" dictate of the offender. For all of the above reasons, a very high percentage of victims of molestation by clerical abusers never tell anyone of their experience(s).

[As early as the mid-1960s, psychologists were already treating both priests and their victims, but none of the victims at that time was willing to be exposed by reporting. Many abused in childhood or adolescence only began to confront their abuse years later when they were adults, often married and successful in business. All of them were badly traumatized by their molestations (some of which lasted for years!) and their lives were a confused shamble of problems and failures (Prendergast 1996, 2003; Sipe 1995, 1999).

[Several times in the 1970s and 1980s, reports in the media, including pioneering investigations by the *National Catholic Reporter*, focused on allegations of sexual abuse by clergy in Boston, Rhode Island, and Louisiana. Bishops in these dioceses managed to ignore the allegations, often transferring the priests from parish to parish without informing the pastor in the new parish of the potential for continued abuse. Finally, in 2002, investigative reporters for the *Boston Globe* documented a massive coverup by Church authorities that forced the Vatican and the Pope to recognize the scandal, and forced the resignation of Bernard Law, the Cardinal Archbishop of Boston, and of other bishops in Florida, Milwaukee, and Phoenix. The media took the lead in publishing these reports on their front pages in large, bold figures. In reality, these molestations have been going on for hundreds of years and have been kept secret and protected by the superiors involved in their denominations. While an improvement has recently occurred, much of the same secrecy and protection continues in the form of transferring accused personnel from one place to another without informing the supervisors at the new assignment of the accusations made. In cases today, many of these cases are hidden from the congregations, go unreported to the authorities, and never reach the light of day (Cozzens 2002; Sipe 1995, 1999).

[The Catholic Church, at the present time, is the primary focus of these investigations. In late 2002 and early 2003, the Archdiocese of Boston, Massachusetts, was a major press focus. Cardinal Law, its appointed leader, followed traditional methods in dealing with accusations against priests and transferred them to other assignments. What

made Boston so striking an example of the problem was the outrage and public denouncement by the lay Catholics, the public, law officials, and even the priests under Cardinal Law's jurisdiction. In a historic "first," the Boston priests sent a petition demanding Law's replacement. In late 2002, Law quietly flew to the Vatican and received permission to resign his post.

[As of early 2003, there were more than 400 pending lawsuits in Boston, with subpoenas for depositions in the Cardinal's handling of these cases. There is a real possibility that the Boston Archdiocese and several other dioceses will have to file bankruptcy because of the staggering amounts demanded by these lawsuits.

[An extensive *New York Times* survey of documented cases of sexual abuse by priests through December 21, 2002, turned up the following findings:

- By the end of 2002, 1,200 priests in 161 of the 177 Latin Rite dioceses in the U.S. were accused of sexual abuse.
- By mid-2003, six bishops and archbishops had been forced to resign because of their involvement in sexual abuse or their complicity in reassigning known sexual abusers.
- Nationwide, 1.8% of all priests ordained from 1955 to 2001 have been charged with abuse.
- Eighty percent of the accused priests were accused of molesting boys. For laypeople accused, 80% of the victims are girls.
- Over half of the accused priests, 57%, were involved only with teenagers; the remaining 43% were accused of molesting children 12 years or younger (Goodstein 2003).
- Most priests accused were ordained between the mid-1950s and the 1970s, a period of great upheaval in the Church, when the Vatican II Council "opened the windows of the church to the world."
- The number of priests accused of abuse declined sharply by the 1990s. Some claim the decline is because of the victims' very slow recognition of their trauma and their delay in reporting the abuse for years.

[In attempting to find a solution to the problem and greatly concerned about the hundreds and even thousands of millions of dollars being awarded in lawsuits, the Catholic Bishops made this subject the focus of their annual meeting in Dallas on June 13-15, 2002. After debates, arguments, and many disagreements, the group came up with a proposed charter for the protection of children (not adults) that was sent to the Vatican in Rome for consideration. The Charter basically contained 13 Articles, as follows:

1. It bars priests who commit sexual abuse from any parish work and all public ministry in the future, and recommends to the Vatican that they be laicized.
2. Any priest who has sexually abused minors more than once in the past will be recommended for laicization.
3. A priest who abused only once in the past will be governed by strict rules determining if he can be returned to ministry after treatment. Victims will have a say in the process.
4. It allows bishops, acting on the advice of an advisory board composed mainly of laypeople (Diocesan Response Team) to decide whether to remove (laicize) abusive clergy from the priesthood.
5. It requires bishops to report all allegations of abuse of minors to civil authorities.
6. It says bishops should no longer make confidentiality agreements in settlement of civil lawsuits over sex abuse unless the victim insists.

7. It requires background checks for all diocesan and parish workers who have contact with children.
8. It requires bishops to provide an "accurate and complete" description of a priest's personnel record if the cleric seeks to transfer to another diocese.
9. It creates a commission to research how the U.S. Church has responded to sex abuse by priests.
10. It creates a national Office of Child and Youth Protection in the U.S. The Conference of Catholic Bishops is to implement "safe environment" programs and take other actions to protect children from abuse.
11. It creates a review board, including parents, to work with the Child Protection Office to annually examine how the bishops are responding to abuse.
12. It has dioceses establish an immediate outreach program to support victims of priestly sexual abuse (*The Sunday Star Ledger* 2002).

[Problems emerged immediately, especially with the second and third articles, which appeared to allow at least one molestation to go unpunished. The Articles were signed by a majority of the Bishops (249 to 2) and forwarded to Rome for Vatican approval. There were many doubts that the Vatican would accept the Dallas recommendations.

[On October 29-30, 2002, the Vatican decision came. Changes were made and, in essence, the Vatican would not accept this tougher policy (U.S. Conference of Catholic Bishops 2002). The following changes were made:

1. The deletion of the reporting requirement was the biggest surprise. Bishops "should comply with all applicable civil laws," said the Vatican. This meant that only about half of the states would be reporting.
2. Priests accused of misconduct would not be removed from functioning as priests until "a preliminary investigation in harmony with canon law is completed."
3. The Vatican insisted that: "all appropriate steps shall be taken to *protect* the reputation of the accused during the investigation." In this circumstance, the parish would not be informed that its priest is under suspicion of sexually abusing children.
4. The new charter also reduces the role and input of diocesan review boards made up of laypeople. The priests could appeal any penalty in secret Church courts run by clerics.
5. The new norms eliminated the requirement to keep victims apprised of the status of the case against a priest.
6. The most problematic change was the apparent elimination of the zero-tolerance provision. The Vatican reinstated the statute of limitations. This requires a victim to report his or her abuse within 10 years of turning 18, or by age 28. There is continued debate over this requirement (Goodstein 2002).

[The Bishops, however, concluded that their document "remained essentially intact" and that their promise to protect children remained strong.

[One thing that must be stated in all of this is that priests do not become sex molesters and perverts, but perverts and sex molesters become priests. The importance of this factor lies in the fact that it makes it possible to perform pre-screening testing by qualified sexologists and sex therapists in order to identify potential problems and make recommendations regarding suitability or treatment to the referring agency (the Bishops). This would eliminate 75% to 80% of the pedophiles and hebophiles from the priesthood and prevent damaging young, impressionable children and adolescents.

[A second factor that must be addressed is the common confusion regarding homosexuality and these pedophilic molestations. There is no connection! Mature adult homosexuals are not interested in children or adolescents. Here again, these molesters were already pedophiles or hebephiles *prior* to becoming priests. Continuing cases of homosexual behavior and molestation in the seminaries confirms this hypothesis. Again, the urgent need for qualified screening and testing prior to acceptance, and even during training, becomes a paramount prevention need (Prendergast 1996, 2003).

[In July 2003, as this *Encyclopedia* went to press, the attorney general for the State of Massachusetts released his report of a 16-month investigation of the Roman Catholic Archdiocese of Boston that involved 30,000 pages of Church documents and 100 hours of grand jury testimony. According to this 76-page official report, 789 children were known to have been sexually abused by 250 priests and other church workers in the Roman Catholic Archdiocese of Boston between 1940 and the present. However, the attorney general clearly stated that he had "absolutely no doubt that the number [of abusers] is far greater." No criminal charges would be filed against Church authorities, because the laws in effect at the time did not require clergy to report suspected cases of sexual abuse of minors. However, civil charges are likely to be filed by the victims, in suits that could easily force individual Church entities into bankruptcy. Summing up this report, the attorney general blamed the scandal on "a massive, inexcusable failure of leadership by the Archdiocese of Boston" and on "an institutional culture" of secrecy that prompted Church leaders to protect the Church and "sacrifice the children for many, many years." (*End of update by W. Prendergast*)]

[*Comment 2003*: A factor that appears not to have been publicly recognized is the fact that a significant number of Catholics have strong internal conflicts surrounding sexuality, probably as a result of their Catholic indoctrination. This is especially true, it seems, for boys who might feel some attraction for males as they approach and enter adolescence. Thus, although a majority might enter the priesthood because of true spiritual involvement with Catholicism, it appears that a certain number of boys do so in an attempt to resolve these conflicts between their internalized Catholic beliefs and their troubling sexuality. This is based on the belief, promoted by Catholic theology like many other theologies, that spiritual devotion will negate the "temptations of the flesh," a totally unrealistic and untrue belief rooted in the antisexualism of both Catholic and other religious and cultural belief systems. Hence, we find some observers arguing for allowing priests to marry, which continues to not be an option for the Church. (It is interesting to note further, that one major factor for why priests were originally forbidden to marry was not because of any spiritual basis, but because the Church wanted to stem the flow of the large sums of money as inheritances that went to the wives of priests and bishops when they died, which otherwise would have remained with the Church.) Thus, the task of reforming the Church's attitudes toward sexuality as a whole remains a complex issue that could be accelerated by the current sexual-abuse crisis involving priests. Nevertheless, it is important to point out that the vast majority of priests do *not* sexually molest anyone, although they still often teach many of the sexually unhealthy doctrines of the Church. (*End of comment by R. J. Noonan*)]

### *Satanic Ritual Abuse*

SHARON E. KING

"Satanic" ritual abuse is another area of recent concern. As the 1989 report by the ritual abuse task force by the Los

Angeles County Commission for Women shows, it is a controversial area that requires careful and serious attention. Books and groups dealing with cult and ritual abuse continue to expose this alarming and controversial topic. Unfortunately, it often takes on the atmosphere of a circus and witchhunt. There is no scientific evidence that this type of child sexual abuse is widespread or common.

### *Recovered Memories and False Memory Syndrome*

DIANE BAKER and SHARON E. KING

Of great concern recently are a number of cases involving children in daycare centers reporting that they were sexually abused by their caretakers. Although some investigations have led to convictions, other cases have been found to lack any substance at all. In one case, a middle-aged male retracted his charge that a prominent Catholic cardinal archbishop had sexually abused him when he was in the seminary, claiming that his lawyer had probably prompted or influenced his "recovered memory" of being abused.

Concern over false reporting is not limited to young children. Teachers all over the country report that they no longer touch their students as they once did. Hugging a child, allowing a young child to sit on one's lap, or being alone in a room with a child are just some of the things that teachers must now monitor. Cases in which children have projected sexual abuse that was happening at home onto a teacher, and the false reporting of sexual abuse by a teacher in order to get back at the teacher are now issues that mental-health workers and the legal system must unravel in some of the more unusual cases placed before the courts.

Better questioning of young victims by mental-health and legal workers is one area that continues to improve. As with any inquiry, it has become evident that the invitation to tell what happened cannot, in any way, be colored by suggestive questioning on the part of the interviewer.

Increasing numbers of adult women and men have begun to disclose incidents of sexual abuse that happened to them when they were children. Their sexual abuse occurred during a time when it was not safe for children to disclose such information and when the support systems of the state and therapeutic communities were not in place.

In some incidents where adults disclose what happened to them as children, they have always known what happened to them, but they have never before spoken out or sought help. In some instances, however, adults report "remembering" or retrieving lost memories of childhood sexual abuse. Remembering and dealing with unresolved issues of childhood sexual abuse can often explain to a victim how and why his or her life has been affected by the abuse. Weight problems, depression, sleep disturbances, intimacy and sexual disorders, unexplained fears, compulsive behaviors, self-esteem issues, and psychosomatic disorders are just a few of the symptoms that can be resolved when an adult finally confronts the repressed and unresolved trauma of childhood sexual abuse.

In a response to their own daughter's accusation of being sexually abused by her father, the Freyds' of Philadelphia started an organization that examines the False Memory Syndrome. Dr. Pamela Freyd and her husband have been most public in their denial of their daughter's accusations, basing their response on a belief that her "memories" were suggested by her therapist. After a period of silence on her part, Dr. Jennifer Freyd publicly countered her parents' denial of what happened to her, citing her mother's public debate as yet another example of her intrusiveness. Whatever the struggle between the members of the Freyd family, this small organization has brought forth a concern about the authenticity and reliability of retrieved memories.

**Sexual Harassment**

ROBERT T. FRANCOEUR

Public awareness of sexual harassment is also a recent phenomenon in American culture, even though sexual discrimination was prohibited by federal law over 30 years ago by Title VII of the 1964 Civil Rights Act. In 1979, Stanford University Law School professor Catharine MacKinnon broadly defined sexual harassment as “the unwanted imposition of sexual requirements in the context of a relationship of unequal power.” More-recent definitions include unwanted sexual advances, touches, and actions between peers and coworkers. Sexual harassment can also occur when a subordinate offers sexual favors in return for a promotion, better evaluation, or grade.

A 1976 *Redbook* magazine survey reported that 88% of the more than 9,000 women responding reported having experienced overt sexual harassment and regarded it as a serious work-related problem. A 1988 *Men’s Health* survey reported 57% of the magazine’s male readers stated they had been sexually propositioned at work, and 58% admitted they had at least occasional sexual fantasies about coworkers.

In a broad survey of over 20,000 federal government workers, 42% of the women and 15% of the men reported having been sexually harassed at work in the preceding two years. Most of the harassers, 78%, were male. Both women and men victims reported that the harassment had negative effects on their emotional and physical condition, their ability to work with others on the job, and their feelings about work. Women were considerably more likely than men to have been harassed by a supervisor, 37% versus 14% (Levinson et al. 1988).

A random-sample survey of undergraduate women at the Berkeley campus of the University of California found that 30% had received unwanted sexual attention from at least one male instructor during their undergraduate years. Examples of harassment included: verbal advances and explicit sexual propositions; invitations to date or to one’s apartment; touches, kisses, and fondling; leering or standing too close; writing emotional letters; being too helpful; and offering grades in exchange for sexual favors (see Table 16).

It took over 15 years for the government to identify the sexual-harassment implications of the 1964 Civil Rights Act, and even longer for business corporations to understand the law. In a 1981 *Redbook-Harvard Business Review* survey, 63% of the top-level managers and 52% of middle managers believed that “the amount of sexual harassment at work is greatly exaggerated.” Although the amount of sexual harassment in the workplace has probably decreased because of the growing awareness of its risks, *Working Woman* reported that at least some business managers believe that “More than 95% of our complaints have merit” (Gutek 1985).

Although most research on sexual harassment has focused on its occurrence in the workplace and academia, sexual harassment has also been studied in the relationship be-

tween psychologists or psychotherapists and their clients, and between physicians and other healthcare workers and their patients.

In 1991, televised hearings of Supreme Court nominee Clarence Thomas and Anita Hill captured the nation’s attention and sparked considerable debate and a growing awareness of sexual harassment. About the same time, the United States Navy became the focus of congressional investigations and media headlines when close to 100 male pilots and officers at an annual Tailhook convention were charged with blatant examples of sexual harassment. Sexual harassment was also the subject of *Disclosure*, a popular and powerful 1994 film dealing with a female executive sexually harassing a male employee. As a result, practically every American corporation, professional organization, and educational institution has been forced to develop and adopt a statement defining the nature of sexual harassment and its policies for responding to it.

The “interim guidelines” issued by the Equal Employment Opportunity Commission in 1980, established that “unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature constitute sexual harassment” when

1. submission to such conduct is made either explicitly or implicitly a term or condition of an individual’s employment,
2. submission to or rejection of such conduct by an individual is used as the basis for employment decisions affecting such individual, or when
3. such conduct has the purpose or effect of substantially interfering with an individual’s work performance or creating an intimidating, hostile, or offensive working environment.

In 1985, sociologist Barbara Gutek explained the occurrence of sexual harassment in the workplace in terms of a gender-role spillover model. She defined a work role as “a set of shared expectations about behavior in a job,” and a gender role as “a set of shared expectations about the behavior of women and men.” Gender-role spillover occurs when gender roles are carried into the workplace, often in inappropriate ways, for example, when the woman in a work group is expected to make coffee or take notes at the meeting. Despite many attitudinal changes in American society, women are still often seen as subservient and sex objects. When these aspects of gender roles spill over into the workplace, sexual harassment can easily occur, despite its negative effects on the employees and organization (Gutek 1985, 17).

*[False Accusations of Sexual Harassment and Rape*

RAYMOND J. NOONAN

*[Comment 2003:* Troubling news reports occasionally surface about false accusations of both rape and sexual harassment, as well as child sexual abuse, domestic violence, and other sexual assaults, that threaten to undermine the effectiveness of efforts to prevent these crimes. At the same time, false reports can destroy the lives and livelihoods of those falsely accused in ways similar to the victims of actual occurrences of these crimes. At one level, it trivializes the experiences of true victims and makes it more difficult for some of them to come forward. Yet, false accusations are typically not taken as seriously by many people, including the legal system, the media, and the general public, much as awareness of the true crimes were often brushed aside in the past. Statistics from Canada suggest that at least 5% of rape allegations are untrue; other reports from the U.S. suggest levels of false accusations as high as 50% or more. Little re-

**Table 16**

**Varieties of Sexual Harassment in the Workplace**

Type of Harassment	% of Males Reporting	% of Females Reporting
Uninvited sexual attention	20	50
Touching	16	45
Suggestive invitations, talk, and joking	15	42
Harassed by same sex	12	7

Based on De Witt 1991; U.S. Merit Systems Board 1981, 1988; and other sources.

search is being done, generally, on why they occur or what the true incidence is, although some information can be obtained at some men's rights websites. Financial and political gain, personal revenge, morning-after regrets, and ammunition in divorce and custody battles appear to be some of the motivations. Nevertheless, it is likely that the levels are currently underestimated, with the problems associated with them affecting both men, women, families, and children, although the brunt of false accusations are typically directed at men. Young (1999), Patai (1998), and others have begun to document these hidden statistics, including the near-equal levels of domestic abuse by both men and women against each other. Certainly, these are issues that need further investigation to find out the true extent of the problems and ways to combat them—at the same time that effective measures are sought to stop the true instances of sex crimes and to help victims on both sides of the coin. (End of comment by R. J. Noonan]

## B. Prostitution/Sex Workers

ROBERT T. FRANCOEUR and  
PATRICIA BARTHALOW KOCH

### *Historical Perspective*

In the American colonies and early days of the United States, prostitution did not thrive in the sparse rural population. Despite a shortage of women, there were still women on the financial fringe in the small cities—recent immigrants and unattached, single women with few skills—for whom prostitution provided a way of survival and, at times, a way to find a husband or other male supporter. Female servants, apprentices, and slaves were not allowed to marry—a custom that encouraged prostitution. In contrast, indentured male servants were apprentices and could earn money to support themselves and their families, although they received no salary. Until the end of the American Civil War, African and Caribbean women brought to the United States in the slave trade were frequently and regularly exploited sexually by their owners (Barry 1984).

In the 19th century, the Industrial Revolution in New England and the Middle Atlantic cities precipitated a massive influx of women from rural areas and from abroad looking for work and other opportunities. For example, women preferred the freedom that textile-mill work gave them to the tightly regulated life of a domestic servant, even though the wages were lower. There was little, if any, social life available after work hours for these single persons living apart from their families. Since they often shared a boarding house room with six to eight women, sometimes sleeping three to a bed, they frequently found their only relief at the local tavern. With men moving to the western frontier and a surplus of women, some women turned to prostitution for escape or affection. Too often they found that only sex work offered them a living wage (D'Emilio & Freedman 1988).

Throughout the mid-1800s, waves of immigration created a surplus of males who left their wives and families in Europe. In each new wave of immigration, some of the unattached immigrant women turned to prostitution in an effort to survive; some were already involved in "the trade." Males far outnumbered women in the western frontier towns and mining camps. Thousands of women were imported from Mexico, Chile, Peru, the South Pacific, and China to work in the flourishing brothels. After the Civil War, American cities followed the European practice of segregating prostitutes to certain areas of the city, which came to be known as "red-light" districts, and requiring them to register or be licensed. Regular physical examinations were required of all sex workers.

Between 1880 and 1920, prostitution was commonplace and legal. Since few prostitutes bothered to register, licens-

ing was not effective in controlling disease. Police supervision only spawned crime and corruption via bribes for protection or "looking the other way." In 1910, Congress passed the Mann Act, which forbade the transportation of women across state lines for "immoral" purposes. In the decade before World War I, the Social Hygiene Movement, Women's Christian Temperance Union, Young Men's Christian Association, and other "purity" organizations worked for the criminalization of prostitution. By the end of World War I, these efforts were successful in ending politicians' tolerance of prostitution. "Legal brothels were destroyed and prostitutes were dispersed from stable homes in red-light districts to the city at large where they were less likely to be self-employed or work for other women and more likely to be controlled by exploitive men including pimps, gangsters, slum landlords, unscrupulous club owners, and corrupt politicians" (McCormick 1994, 91).

Currently, prostitution is illegal in all states except Nevada, where a 1971 court decision allowed counties with a sparse population the discretion of legalizing and licensing prostitution. State legal codes forbid making money from the provision of sexual services, including prostitution, keeping a brothel, and pandering, procuring, transporting, or detaining women for "immoral" purposes. Patronizing a prostitute is illegal in some states; a convicted offender may face a fine of \$500 or more and a year or more in jail. In some states, pimps may be sentenced to 10 to 20 years in jail and fined \$2,000 or more.

### *The Spectrum of Sex Workers and Their Clients*

Sex workers vary greatly in status, income, and working conditions, as well as in the services they offer—oral sex being the most common sexual practice offered. The vast majority of sex workers are females with male customers. Most prostitutes view their work as temporary, often on a part-time basis to supplement their traditionally female, poorly paid employment, and to support themselves and their families (McCormick 1994). The average prostitute's career lasts five years, since youthful attractiveness is valued by customers. The sexual orientation of female sex workers reflects that of the larger population, and includes heterosexual, lesbian, and bisexual women. While sex workers are predominantly female, the "managers," at all levels, are predominantly male. Pimps—those who live off the earnings of a sex worker—often exploit the workers' romantic feelings, emotional needs, or fear of violence, and often come from disenfranchised groups themselves.

On the one hand, many believe that females turn to prostitution because of dysfunctional families and individual psychopathology. The belief that female prostitutes are more likely than other women to be depressed, alienated, emotionally volatile, or engage in criminal activities and excessive use of alcohol and street drugs are often based on small, specialized samples (McCormick 1994). Research is also inconclusive as to the proportion of sex workers who abuse alcohol and other drugs. At least one study has indicated that call girls were as well adjusted as a control group of nonsex-worker peers who were matched for age and educational level (McCormick 1994). Yet, for many juveniles, sexual and physical abuse seems to be related, at least indirectly, to their becoming involved with prostitution.

On the other hand, economic survival, not psychopathology, may be the most important contributing factor to engaging in prostitution. Poor and disadvantaged women may engage in sex work because it is the best-paying or only job available. More-advantaged women may also engage in sex work because of the often unparalleled economic rewards, coupled with the flexibility in working

hours, and the sense of control over clients. Although non-commercial sex is described as more satisfying by most sex workers, many report achieving satisfaction and orgasm through their work (Savitz & Rosen 1988).

On the lowest rung of female and male sex workers are those who solicit on the street; above them are those working in bars and hotel lobbies. Their limited overhead is matched by their low fees. Streetworkers, usually from the lower socioeconomic class or runaway teenagers, face high risks of violence, robbery, and exploitation, as well as drug addiction, STDs, and HIV infections. Approximately 35% of streetwalkers have been physically abused and 30 to 70% raped while on the job (Delacoste & Alexander 1987). In addition, because of their visibility, streetworkers are the most vulnerable to harassment and arrest by law enforcement agents. While 10% to 20% of sex workers are streetwalkers, they constitute 90% of sex-worker arrests. Prostitution is the only crime in America in which the majority of offenders are female. In dealing with prostitutes, the courts often become a "revolving door system," with the sex worker posting bail and back on the street shortly after being arrested. Paradoxically, she is often fined, making it financially important for her to turn again to sex work to survive.

Government estimates suggest that half of the five million teenagers who run away from their homes each year spend at least some time as sex workers. Poor self-images, rejection by peers, few friends, unsupervised homes, and emotional, if not sexual, abuse in the home make them susceptible to the lure of big-city glamour where their survival needs force them to find work on the streets.

Houses of prostitution are less common today than they were in the past. The famous houses of the Storyville area of New Orleans or San Francisco's Barbary Coast were often very luxurious, and women both lived and worked in the same brothel for many years. Because of legal problems, most brothels today are rundown and in disrepair. If tolerated by the local police, they may be better maintained. In many places, regular, "go-go," and "topless" bars and massage parlors double as "fast-service" brothels. Brothels sometimes advertise their services in "underground" newspapers or in the "free press."

Escorts and call girls are at the upper level of sex workers. Young, slender, attractive, middle- and upper-class white women command the highest fees and the best working conditions among sex workers. Call girls typically see a small number of regular, scheduled clients. For them, sex work provides a much higher income than they would earn in almost any other profession, plus better control over their working hours.

The typical customer of a female sex worker, a "john," appears indistinguishable from the average American male. They are often involved in sexual relationships with another woman and report that they purchase sex by choice—perhaps for the adventurous, dangerous, or forbidden aspects of sex with a prostitute. Some frequent prostitutes because their usual sexual partners are unwilling to participate in certain sexual behaviors (like oral or anal sex). Other men frequent prostitutes because they have difficulty in establishing an ongoing sexual relationship because of lack of opportunity or physical or emotional barriers.

Most heterosexual male prostitutes are not street hustlers, but have steady customers or relationships that are ongoing and similar to those of a high-priced call girl. Their clients are often wealthy older women. Much more common are males who sell their sexual services to other males. In fact, most male prostitutes identify themselves as homosexual or bisexual. In large cities, gay male prostitutes

cruise gay bars, gay bathhouses, public toilets, bus and train stations, and other areas known to local clients.

Sex work also includes a variety of erotic entertainment jobs, including erotic dancing, live pornography or "peep shows," and acting in pornographic films and videos. Female burlesque shows have long been part of the American scene. However, the professional burlesque queens of the past have been replaced by amateur, poorly paid "table dancers." Feminists Barbara Ehrenreich, Gloria Hass, and Elizabeth Jacobs (1987) maintain that male go-go dancers play a role in advancing the rights of women and in breaking down patriarchal biases, because their female viewers treat them as sex objects and reduce their phallic power to impotence within bikini shorts.

The incidence of HIV infection and AIDS varies among sex workers and is increased by IV-drug use, untreated STDs, and unsafe-sex practices. In general, it is high among female and gay male sex workers on the street, and lowest among high-priced call girls and heterosexual male prostitutes.

### *Economic Factors*

In the early 1990s, there were an estimated 450,000 female prostitutes working in the United States, a profession lacking job security and fringe benefits, such as health insurance and social security. Most working outside the high-class escort services do not pay taxes. Nor are taxes paid on any of the monies that are exchanged in the underground economy associated with prostitution, such as: the monies that pass between prostitutes and their pimps; the hotel, motel, massage parlor, or bar owners and clerks; or the recruiters like cab drivers and doormen who make prostitution possible.

A 1985 survey of the cost of enforcing antiprostitution laws in the 16 largest cities of the U.S. estimated police enforcement costs at \$53,155,688, court costs at \$35,627,496, and correction costs at \$31,770,211, for a total 1985 cost of \$119,553,395. In 1985, Dallas, Texas, police made only 2,665 arrests for the 15,000 violent crimes reported. They made 7,280 prostitution arrests at a cost of over \$10 million and almost 800,000 hours of police work. In 1986, Boston, Cleveland, and Houston police arrested twice as many people for prostitution as they did for all homicides, rapes, robberies, and assaults combined. Meanwhile, 90% of perpetrators of violent crimes evaded arrest. Between 1976 and 1985, violent crimes in the 16 largest cities rose by 32% while arrests for violent crimes rose only 3.7%, and arrests for robbery and homicide actually dropped by 15%. Equally important, the 16 largest cities continue to spend more on enforcing prostitution laws than they do on either education or public welfare (Pearl 1987).

Working in pairs, police spend an average of 21 hours to obtain a solicitation, make an arrest, transport the prostitute to the detention center, process her papers, write up a report, and testify in court. Undercover police cruising the street looking to get a solicitation need frequent changes of disguises and rented cars. Making an arrest of a call girl is even more difficult, requiring greater expense for false identification and credit cards, hotel room, luggage, and other paraphernalia to convince the call girl this is a legitimate customer and not a policeman. The hotel room is usually wiretapped and the solicitation videotaped.

Arrests of prostitutes working in massage parlors present their own difficulties. It usually takes half an hour for an undercover policeman to undress, shower, and get into the massage before an illegal service is offered. For a while, Houston police ran their own parlor. When that was declared entrapment by the courts, teams of 10 undercover of-

ficers began working existing modeling studios as customers. "Ten officers at a time, at \$60 each, with no guarantee that we'd get solicited. . . . We could spend \$3000 or \$4000 and not make a case" (Pearl 1987).

### Current and Future Status

Historically, sex workers have been blamed for the spread of sexually transmissible diseases (STDs). However, recent research has indicated that sex workers are much more likely to practice safer sex than the "average teenager" (McCormick 1994). While prostitutes are being blamed for transmitting HIV to their clients, data from the Centers for Disease Control indicate that only a small proportion of persons with AIDS contracted HIV from a prostitute. However, rates of HIV infection are quite high—up to 80%—among sex workers who also use intravenous drugs. Unfortunately, sex workers are usually at higher risk of contracting an STD, including HIV, from their lovers with whom they do not use a condom than from their clients with whom they use a condom.

Today in the United States, religious and political conservatives and radical feminists continue to oppose prostitution through such groups as WHISPER (Women Hurt in Systems of Prostitution Engaged in Revolt), an organization devoted to rescuing women and children from sex work. On the other hand, sex workers have begun to organize and advocate better working conditions and treatment through such groups as COYOTE (Call Off Your Old Tired Ethics), Scapegoat, and U.S. PROstitutes. These groups lobby for the decriminalization and legalization of prostitution, inform the public about the realities of prostitution, and offer various services to sex workers. In addition, liberal feminists inside and outside of the sex industry have founded the International Committee for Prostitutes' Rights (ICPR) in order to preserve their rights to life, liberty, and security.

In spite of continued economic inequities in the United States, some observers believe prostitution will decline because of the availability of effective contraceptives, a continued liberalization of sexual attitudes and divorce, a decline in the double standard in employment and sexual expression between the genders, and the risk of AIDS. In the Kinsey study of male sexuality in the late 1940s, 69% of white males reported having had at least one experience with a prostitute. The recent national study of 18- to 59-year-olds, *Sex in America*, found that only 16% of the men ever paid for sex (Gagnon, Laumann, & Kolata 1994). Yet, it seems that prostitution will continue to exist in some form or another. Although some people support the decriminalization of sexual activity between consenting adults, whether or not money is exchanged, this is not likely to happen in the United States.

## C. Pornography and Erotica

ROBERT T. FRANCOEUR

### The Legal Context

A landmark legal definition of obscenity was established by the Supreme Court in the 1957 *Roth v. the United States* decision. For a book, movie, magazine, or picture to be legally obscene,

- the dominant theme of the work, as a whole, must appeal to a prurient interest in sex;
- the work must be patently offensive by contemporary community standards; and
- the work must be devoid of serious literary, artistic, political, or scientific value.

This ruling permitted the publication in the U.S.A., for the first time, of such works as D. H. Lawrence's *Lady Chatterley's Lover*, James Joyce's *Ulysses*, and works by

Henry Miller. However, this definition left the meaning of the term "community standards" unclear.

In the 1973 *Miller v. the United States* decision, the Supreme Court attempted to tighten the restrictions on obscene material by requiring that defenders of an alleged obscene work prove that it has "serious literary, artistic, or scientific merit." Despite this clarification, the courts still faced the near-impossible task of determining what has "literary, artistic, or scientific merit," who represents the "average community member," and what the "community" is. In 1987, the Supreme Court attempted to refine the *Roth* and *Miller* decisions by saying "a reasonable person," not "an ordinary member of the community," could decide whether some allegedly obscene material has any serious literary, artistic, political, or scientific value. Justice Potter Stewart further confused the situation when he remarked that "You know it when you see it."

In 1969, the Supreme Court ruled that private possession of obscene material was not a crime and is not subject to legal regulation. However, federal laws continue to prohibit obscene material from being broadcast on radio and television, mailed, imported, or carried across state lines. In recent years, pornographic material of any kind involving underaged children has been the target of repeated federal "sting" operations, raising issues of police entrapment.

### Research Models

For at least two decades, there has been often-heated debate among the public, among feminists groups, and among scientists regarding the social and psychological impact of pornography, particularly materials that link sex with the objectification of women and with violence. A psychological research theory, the catharsis model, assumes that pornography and other sexually explicit materials provide a "safety valve" in a sexually repressive society. This model views pornography and other sexually explicit materials as "not so good, perhaps disgusting, but still useful" in diverting tensions that otherwise might trigger aggressive antisocial behavior. A different hypothesis suggests an imitation model in which sexually explicit books, pictures, and movies provide powerful role models that can, by conditioning and scripting, promote antisocial, sexually aggressive behavior. A third model of pornography addresses the personal and societal uses of pornography in different cultures, as a product designed as an alternative source of sexual arousal gratification and a way of enhancing masturbation. There are also models of pornography based on communication, Marxist, psychoanalytic, feminist, and religious theories (Francoeur 1991, 637).

### Commission Studies

A 1970 White House Commission funded research by experts in the field and concluded that neither hardcore nor softcore pornography leads to antisocial behavior and recommended that all obscenity laws except those protecting minors be abolished. The majority of the commission concluded that pornography provides a useful safety valve in an otherwise sexually repressive culture. President Richard Nixon refused to officially accept the commission's report.

A 1986 investigation by then-Attorney General Edwin Meese did not sponsor any new research and took a different approach in reaching its conclusion. This commission reexamined the alleged connection between pornography and child abuse, incest, and rape by inviting anyone interested in speaking to the issue. The commission was widely criticized for having a preset agenda, for appointing biased commission members, and for relying on "the totality of evidence," which gave equal weight to the testimony of fundamentalist

ministers, police officers, antipornography activists, and putative victims of pornography. This allowed the commission to conclude there is a "proven" causal connection between violent pornography and sexual assaults. This commission concluded that there is a causal connection between viewing sexually explicit materials, especially violent pornography, and the commission of rape and other sexual assaults. The commission recommended stricter penalties to regulate the pornography traffic, enactment of laws to keep hardcore pornography off home cable television and home telephone services, more vigorous prosecution of obscenity cases, and encouraged private citizens to use protests and boycotts to discourage the marketing of pornography. Among the many criticisms of the Meese Commission, Robert Staples, a black sociologist, pointed out that in the black community, pornography is a trivial issue. It is "a peculiar kind of white man's problem," because blacks see the depiction of heterosexual intercourse and nudity, not as a sexist debasement of women, but as a celebration of the equal rights of women and men to enjoy sexual stimuli and pleasure (Nobile & Nadler 1986).

Concurrent with the *Meese Commission Report*, the 1986 *Report of the U.S. Surgeon General* concluded that we still know little about the patterns of use or the power of attitudes in precipitating sexually aggressive behavior. Much research is still needed in order to demonstrate that the present knowledge of laboratory studies has significant real-world implications for predicting behavior. This report did not call for censorship, boycotts, and other tactics advocated by the Meese Commission. Rather, it recommended development of "street-based, innovative approaches" to educate the public about the different types of sexually explicit material and their possible effects.

### Local Efforts at Regulation

In 1985, Andrea Dworkin, Catherine MacKinnon, and Women Against Pornography joined forces with local citizens' groups in Minneapolis, Minnesota, and Long Island, New York, to promote a new kind of pornography legislation. Using a civil rights argument, the proposed legislation stated that

Pornography is sex discrimination. [Where it exists, it poses] a substantial threat to the health, safety, peace, welfare, and equality of citizens in the community . . . Pornography is a systematic practice of exploitation and subordination based on sex that differentially harms women. The harm of pornography includes dehumanization, sexual exploitation, forced sex, forced prostitution, physical injury, and social and sexual terrorism and inferiority presented as entertainment.

The proposed legislation would have made producing, selling, or exhibiting pornography an act of sex discrimination. Women forced to participate in pornographic films, exposed by force of circumstances to view pornography in any place of employment, education, home, or public place, or assaulted by a male inspired by pornography could sue in civil court for damages based on sex discrimination. The American Civil Liberties Union (ACLU), Feminist Anti-Censorship Taskforce (FACT), and others challenged this kind of legislation. After considerable nationwide debate about civil rights, sex discrimination, and the constitutional right to free speech, these legislative efforts were abandoned.

### Contemporary Aspects

The availability of sexually explicit, X-rated videocassette rentals and sales has become a major factor in American home entertainment. In the past decade, feminist softcore pornography or erotica has made its mark in the popular me-

dia by portraying women as persons who enjoy sexual pleasure as much as men. This material appears in the pages of such mainstream women's magazines as *Cosmopolitan*. It is promoted by sex boutiques, with names like Eve's Garden, Adam and Eve, and Good Vibrations, catering to women. Another growing phenomenon is a variation on the Tupperware and Mary Kay Cosmetics home parties that bring women the opportunity to examine and, of course, purchase sex toys, love lotions, and lingerie in the privacy of their homes, surrounded by other women with whom they are friends. Exotic lingerie is also available in specialty stores in major shopping malls and by mail order from Victoria's Secret and Frederick's of Hollywood. Since 1992, Feminists for Free Expression, opposed to censorship and supported by such notables as Betty Friedan, Erica Jong, and Nancy Friday, has countered the efforts of some feminists to suppress pornography with an alternative view for the feminist community.

Erotic romance novels have become an acceptable form of softcore pornography for women. Far outselling gothic novels, science fiction, self-help, and other books aimed at women, erotic romances often center around a traditional rape myth, a story in which the woman is at first unwilling, but finally yields in a sensual rapture to a man. In nonsexual characteristics, women who read erotic romantic novels are very much like women who do not. However, they appear to enjoy sex more and have a richer sexual fantasy life (Coles & Shamp 1984; Lawrence & Herold 1988).

Researchers and theorists, both feminist and nonfeminist, have almost completely ignored the existence of gay pornography. Lesbian pornography tends towards two extremes, about evenly divided in popularity, with little middle ground. Small independent presses publish softcore pornography or erotica. Erotica on audiocassettes are very popular among lesbians. On the other side is a hardcore lesbian literature with a strong SM character that makes some feminists uncomfortable. *On Our Backs*, a tabloid magazine, is the largest publication of this type. *Eidos*, another tabloid, carries numerous ads for lesbians who desire bondage and dominance or sadomasochistic relations.

Considerably more pornography designed for homosexual men is available. Most of this genre is hardcore pornography with an emphasis on leather, SM, and younger males. At the same time, gay videos have pioneered in eroticizing the condom, nonoxynol-9, and safer-sex practices.

Dial-a-porn, or telephone sex, is a multimillion-dollar-a-year business producing massive profits for telephone companies and the companies providing phone-in services. In one year, dial-in services, including dial-a-porn, earned Pacific Bell \$24.5 million and the phone-in companies \$47.2 million. Because of constitutional concerns, the Public Utilities Commission and Federal Communications Commission (FCC) do not allow telephone companies to censor telephone messages or to discriminate among dial-for-a-message 1-900 services on the basis of content. Telephone companies cannot legally deny telephone lines to adults willing to pay the bill, although at least one court has ruled that it is not unlawful discrimination for a telephone company to refuse to provide services for dial-a-porn services. The FCC does require dial-a-porn services to screen out calls by minors by supplying their customers with special access numbers or having them pay by credit card. Concerned parents may pay a one-time fee to block all phones in a residence from access to dial-a-porn.

### D. Paraphilias and Unusual Sexual Practices

BRENDA LOVE

In 1990, a Los Angeles man named Jeff Vilencia formed a group called Squish Productions. Through magazine arti-

cles, television appearances, and radio interviews, Vilencia had attracted more than 300 members to his group by 1995, all of whom shared the fetish of becoming aroused by the sight of others stepping on small living things such as snails and insects.

Although the fetish shared by Vilencia and his fellow members in Squish Productions may seem—and may in fact be—novel, paraphilias are nothing new. Paraphilias and fetishes have most likely been in existence in the U.S. for as long as there have been inhabitants on the Western continents. Although while a few immigrants may have brought sexual preferences, such as autoerotic asphyxiation, sadomasochism (SM), foot fetishes, and bestiality with them, other paraphilias have unquestionably developed here. In the world of paraphilias and fetishes, there is always something new. And thanks to increased awareness of and access to information about unorthodox sexual practices and their practitioners, interest in paraphilias appears to be growing in the United States.

### Definitions

“Fetish,” as defined for the American health professional by the *Diagnostic and Statistical Manual of Mental Disorders III (DSM III)*, “is the use of nonliving objects (fetishes) as a repeatedly preferred or exclusive method of achieving sexual excitement.” Such objects “tend to be articles of clothing, such as female undergarments, shoes, and boots, or, more rarely, parts of the human body, such as hair or nails” (American Psychiatric Association 1980).

The manual also states that the fetish object “is often associated with someone with whom the individual was intimately involved during childhood, most often a caretaker. . . . Usually the disorder begins by adolescence, although the fetish may have been endowed with special significance earlier, in childhood. Once established, the disorder tends to be chronic” (American Psychiatric Association 1980).

“Paraphilias,” on the other hand, are defined by *DSM III* as recurrent, fixed, compulsive, sexually motivated thoughts or actions by a personally or socially maladjusted individual that interfere with the individual’s capacity for reciprocal affection. It is important to note that a paraphilia is not merely an activity that may appear strange or disgusting to an observer; rather, the activity or compulsion must meet all of the above criteria to be considered a problem requiring therapy.

It is also important to note in the area of paraphilias that many patients mention their unusual sexual interest simply to receive validation. The therapist can do much for the mental health of a patient by mentioning a support group or club for people with the interest, or by giving the patient the clinical name for the practice, stressing that the term *paraphilia* only applies when the above *DSM III* criteria apply. This can be followed by therapy to improve the person’s self-esteem, communication, and social skills. The confession of activities involving minors or nonconsensual activities, however, of course requires immediate intervention by health professionals.

### Background on Fetishes and Paraphilias in the U.S.A.

Fetishes change according to current fashions and customs. A hundred years ago, fetishists were aroused by such things as handkerchiefs, gloves, black rubber aprons, garters, corsets, enemas, seeing females wring the necks of chickens, or whipping horses. Today many of these stimuli have been replaced by pantyhose, high heels, tennis shoes, cigarettes, escalators, latex, or phone sex.

In addition, today’s technology adds to the variety of ways a fetishist can pursue his or her predilection. In the

past, one had either to create one’s own drawings, or hope to catch a glimpse of an arousing person, object, or situation. Today, the fetishist has access to television, photographs, Internet newsgroups, clubs, videos, and magazines. Membership in fetish groups has increased during the last decade. And as computer technology has decreased the cost of publishing, groups or individuals have been increasingly able to print their own sex magazines, books, and newsletters, thereby avoiding the censorship imposed by mainstream publications.

At the same time, even the more straitlaced mainstream media have helped to increase the information available about fetishes and paraphilias. Unfortunately, many national television talk shows have “cashed in” on fetishes and victims of sexual trauma by sensationalizing their lives, rather than trying to educate the public. Hollywood also sensationalizes the issue, portraying erotic asphyxia, lust murder, sadomasochism, and nipple piercing. An example of the media’s exploitation and sensationalization of unusual sex practices was the hundreds of hours of air time devoted to keeping the public informed of the status of John Wayne Bobbit, the circumstances leading to his castration at the hands of his wife, the subsequent surgical reattachment of his penis, and his appearance in an X-rated video.

Perhaps the most important development in the growth of interest in paraphilias and fetishes has been the Internet, the worldwide computer network through which up to 500,000 “lurkers” a month enter the “alt.sex” newsgroups. Users of these newsgroups, which offer uncensored forums devoted to a wide variety of sexual interests, can exchange or download photos and information, including what would normally be considered illegal in the United States, with other Internet users.

While the Internet has played an increasing role in the lives of fetishists in recent years, it would not be correct to attribute the growing popularity of fetishism and other unorthodox forms of sexuality to the Internet alone, as those in Washington who seek to censor the Internet seem to believe. The role of the Internet is more modest according to Robin Roberts, an Internet guru in California and founder of Backdrop, one of America’s oldest fantasy and bondage clubs. Established in 1965, Backdrop promoted itself with discreet ads in the *Berkeley Barb* with post office boxes or mail-drop services as the method of contact. Today, Backdrop has about 5,700 members, but Roberts does not attribute the club’s growth to exposure on the Internet.

Roberts explains that Internet lurkers rarely participate in dialog and tend not to join sex clubs. They are typically readers of *Forum* magazine or “Letters to the Editor” columns. For those users who do participate in sex online, computers provide anonymity, and a way to explore taboos in a safe, nonthreatening environment. Roberts does note, however, that for those who are active participants in computer sex, rather than just lurkers, the Internet provides 24-hour access to other users, an equal chance to express one’s opinions, and an unlimited number of fantasies. At the same time, Roberts does not feel computer sex will replace fetish clubs, because of the simple fact that electronic mail does not provide touch, intonation of the voice, nuances of speech, or visual impressions.

### The Growing Popularity of Fetishes and Paraphilias

Not everyone who accesses information about paraphilias and fetishes through these new technological avenues is a fetishist. Many are among the growing number of experimenters who, even though they do not have a fetish, will join groups or purchase sex toys and SM paraphernalia.

Such experimentation seems to be on the increase; a 1994 survey conducted in two San Francisco sex boutiques indicated that approximately 55% of their customers had at least experimented with SM (Love 1994).

Ann Grogan, owner of San Francisco's Romantasy boutique, has seen an increase in such experimentation among the customers who frequent her sex-accessory establishment, one of two operating in San Francisco in 1995 geared toward women customers.

"Gender play is becoming more and more popular among customers of all ages, primarily ages 30-50 years," Grogan says. "Couples now buy matching corsets and wrist restraints." During the last five years, females in increasing numbers have shown an interest in transgender play, assuming the dominant role in the sexual relationship. Many men are also expressing an interest in anal sexuality, measured in part by the purchase of dildoes and harnesses to be used on men by the women. And a growing number of recently divorced female customers in their 50s have shown a curiosity about safe sex and pleasuring themselves.

Grogan can also testify to the increasing influence of the Internet:

The latest trend seems to be the appearance of couples who have met on the Internet. They appear together at Romantasy after only one or two meetings, because in previous communications they have gotten far beyond the awkward preliminary dialog about each other's sexual preferences and have jumped into a willingness to act out each other's fantasies. Meeting on the Internet seems to be a "fast track to intimacy." (Grogan 1995)

Ted McIlvenna, president of the Institute for the Advanced Study of Human Sexuality, expects that interest and participation in paraphilias and fetishes will continue to grow. "In the next five years," McIlvenna believes,

we will see a group of people seeking information and support groups for their sex interests which, in the past, people have considered excessive or compulsive. This is not an evil path; instead it is remedial sex education. Because of the massive number of people involved—in the U.S. the estimate is forty million people—I have labeled this the "sexual accessories movement." Mental health professionals, including sexual health professionals, must monitor and study but leave this movement alone; their sexuality belongs to them. We can expect people to buy more, join more, and experiment more, and we can only hope that out of this will emerge societal control methods that will enable people to have better and more fulfilling sex lives. (McIlvenna 1995)

Given the recent and anticipated growth of many of the fetish clubs described below, it is important to ask about what causes paraphilias. Although there has been much scientific interest in this question, science has not yet discovered the etiology of fetishes or "paraphilic lovemaps," according to John Money (1988), the leading expert on paraphilias. It does appear, however, that, as is the case with substance abuse and addiction, a small percentage of the population seems more predisposed toward the development of paraphilias, often because of childhood trauma. Money says,

The retrospective biographies of adolescent and adult paraphiles point to the years of childhood sexual rehearsal play as the vulnerable developmental period. . . . The harsh truth is that as a society we do not want our children to be lustfully normal. If they are timorous enough to be discovered engaging their lust in normal sexual rehearsal

play or in masturbation, they become, in countless numbers, the victims of humiliation and abusive violence. (Money 1988)

Money has explained how these early traumas can lead to paraphilias:

They [adults who subject sexually curious children to abuse] do not know that what they destroy, or vandalize, is the incorporation of lust into the normal development of the lovemap. The expression of lust is diverted or detoured from its normal route. Thus, to illustrate: those adults who humiliate and punish a small boy for strutting around with an erected penis, boasting to the girls who watch him, do not know that they are thereby exposing the boy to risk of developing a lovemap of paraphilic exhibitionism. (Money 1988)

### *Fetish and Paraphilia Clubs*

The United States is probably home to more fetish clubs than any other country. As Brenda Love (1992) wrote in *The Encyclopedia of Unusual Sex Practices*, which catalogs over 700 sexual practices,

international advertising is fairly inexpensive and computerized printing of newsletters has made it simpler to form clubs. People with fetishes as obscure as large penises, big balls, hairy bodies, mud wrestlers, shaving, cigars, used condoms, genital modification, and throwing pies have been able to find others with similar interests willing to form clubs.

Sadomasochist (SM) clubs are probably the most prevalent type of fetish clubs in the U.S.A. today, although very few of the members could be defined as having a true SM fetish or paraphilia.

SM has become an umbrella term for many sexual activities, and because of its accouterments and role-playing, people wanting to experiment with or improve their sexuality join these groups. "It was only in the late fifteenth century that the first unambiguous case report of SM was reported, and then as a medical curiosity rather than a problem" (H. Ellis 1936a). William Simon has eloquently described the allure of SM:

The sadomasochistic script plays upon the potential absolutism of hierarchy, not merely to experience hierarchy with the relief accompanying the elimination of its ambiguities but to experience the dangerous emotions that invariably accompany acknowledgment of its exercise, the rage and fear of rage in both the other and ourselves. (Simon 1994)

Charles Moser (1988) estimates that approximately 10% of the adult population are SM practitioners. This estimate is based on Kinsey's report that approximately 50% reported some erotic response to being bitten (Kinsey 1953). However, there is no direct empirical evidence verifying this estimate. Moser divides SM behaviors

into two types, physical and psychological. . . . Physical behaviors may be further subdivided into the following categories: bondage, physical discipline, intense stimulation, sensory deprivation, and body alteration. . . . Psychological pain is induced by feelings of humiliation, degradation, uncertainty, apprehension, powerlessness, anxiety, and fear. . . . Both physical and psychological behaviors are devised to emphasize the transfer of power from the submissive to the dominant partner. SM practitioners often report it is this consensual exchange of power that is erotic to them and the pain is just a method of achieving this power exchange. (Moser 1988)

Moser lists the common types of clinical problems presented by SM practitioners to their therapists as: "1) Am I normal? 2) Can you make these desires go away? 3) SM is destroying our relationship; 4) I cannot lead this double life anymore; 5) I cannot find a partner; and 6) Is it violence or SM?" (Moser 1988). All but the last question are also the concern of most fetishists.

Foot-fetish club members have a more focused interest than do SM practitioners. Weinberg et al. (1994) conducted a survey of 262 members of a gay foot-fetishist group called the Foot Fraternity that had approximately 1,000 members in 1990, but had grown to over 4,000 by 1995. These sexologists also compared the ratio of self-masturbation during sexual encounters to that of oral-genital activity and to anal intercourse. Fetishists tended to masturbate to orgasm while engaging in foot play rather than experiencing orgasm as a result of some type of penetrative sex with a partner. Furthermore, the researchers discovered that 76% responded that they masturbated themselves to orgasm frequently, whereas 48.1% performed oral-genital activity, and only 9.55% performed anal intercourse.

Weinberg et al. (1994) reported that their research highlighted the psychological importance a support group or club has for fetishists.

Despite the lack of a widespread fetish subculture, the Foot Fraternity itself can be considered an embryonic subculture. Almost 70 percent of the respondents said membership in the Foot Fraternity allowed them to pursue their fetish interests more easily. Some 66 percent said membership increased their interest in feet and footwear, and over 40 percent said that they learned new ways of expressing their sexuality. Thus, the organization helped to sustain, as well as expand, its members' unconventional sexual interest. Almost 70 percent said the Foot Fraternity got them to correspond with others with similar interests, 50 percent that it got them to meet others with similar interests, and 40 percent that this led them to engage in foot play with another member. Finally, over 40 percent said that membership in the Foot Fraternity helped remove confusion about their interest in feet and footwear and almost 60 percent that it increased their self-acceptance. (Weinberg et al. 1994)

These statistics regarding benefits of membership can most likely be applied to other sexual interest groups as well.

Doug Gaines, founder of this Cleveland-based club, estimates that 15% of the U.S. population has a foot or related fetish, an opinion based on the fact that he has received 80,000 requests for club information. He promotes the group in magazines, radio interviews, and a foot-fetish Internet newsgroup.

Interestingly, Gaines seconded the findings of researchers on the genesis of fetishes by identifying childhood experiences, such as being tickled, riding on the foot of a parent ("playing horsey"), or seeing a parent's foot immediately prior to being picked up and nurtured, as predominant memories of most of his members. The Foot Fraternity offers a newsletter, glossy magazine, and videos of men modeling their feet. The selection of photos is determined by a detailed membership questionnaire which asks what type of shoe, sock, or foot the new member finds erotic.

The activities in which foot enthusiasts participate include masturbation while looking at photos of feet, slipping off a partner's shoes in order to smell the stockings and foot, or placing oneself underneath the foot in a submissive posture. The foot is massaged and licked completely (toes, between toes, bottom, etc.). SM dominance and submission scenes, for example, where a partner takes on the role of a policeman and the fetishist must kiss his boot to get out of being given a traffic ticket, are popular.

Another common scene consists of acting out the roles of principal and student. Foot fetishists rarely use pain in their dominance/submission; rather, these scenes simply serve as an excuse for foot worship. A few foot fetishists attend auctions where they are able to purchase shoes once belonging to their favorite sports figures or movie stars hoping that the "scent" of the person remains in the shoe.

Squish Productions, mentioned earlier, can also be viewed as a foot-fetish club. Unlike the Foot Fraternity, Squish has yet to be the subject of any in-depth survey by sexologists. Even so, the genesis of the Squish fetish appears to be similar to that found in other fetishes, as evidenced by Squish founder Jeff Vilencia's recollections of his childhood. Identifying what he considers to be his childhood trigger point in the development of his fetish, Vilencia recalled that, as the younger of two children, he was the "victim" of an older sister who enjoyed kicking and stepping on him. Upon reaching puberty, he discovered feeling aroused when seeing females step on bugs. The bug apparently only serves as a projection of himself, because his fantasy involves taking the bug's place under the woman's foot.

Cross-dressing and other forms of transgender activity are found in many countries. The new *DSM IV* no longer lists this activity as a paraphilia, but rather as "gender dysphoria." Clubs such as ETVC in San Francisco have an extensive library for members, social outings, support-group hotline, newsletter, makeup classes, and lingerie modeling. Membership in ETVC increased from 329 in 1988 to a total of 433 in 1995.

Another group, Texas Tea Party, sponsors an annual party that, after eight years of existence, drew about 400 people in 1995. Estimates on the percentage of the population who have ever cross-dressed range from 1.5 to 10%. Groups attract new members with newspaper and magazine advertisements, appearances on television and radio, magazine articles on the subject, and by staffing a booth at the annual San Francisco Lesbian and Gay Freedom Day Parade and Celebration.

A recent survey of 942 transgenderists by Linda and Cynthia Phillips indicates that most members experienced cross-dressing in puberty, although one member did not begin cross-dressing until the age of 72. The average transgenderist did not seek out a transgender club until his early 40s. Sexual arousal while cross-dressing is also more common during adolescence, and appears to diminish as the boy grows older. Therefore, an adult male transgenderist dresses to feel "feminine," whereas an underwear fetishist uses the lingerie for sexual arousal. (Females who cross-dress do not tend to experience arousal while cross-dressing) (Phillips 1994).

No one knows how many cross-dressers or clubs exist in the U.S., but it is known that many people purchase special-interest cross-dressing magazines. One of these, *Tapestry*, had a 1995 quarterly distribution of 10,000 issues compared to 2,000 five years earlier. And a fairly new magazine, *Transformation*, had an international distribution of 50,000 in 1995.

Infantilism is fairly unique to the U.S. and growing in popularity. Its practitioners take on the persona of infants or young children. They may wear diapers under their business suits, drink from a baby bottle, use an assortment of toys and baby furniture, and, if they have a partner, they may participate by reading bedtime stories, diapering, spanking, or using other forms of affection or punishment.

One practitioner, who asked to be identified only as Tommy, is the founder of Diaper Pail Friends. Inside his home in a prestigious San Francisco suburb, a visitor will

find an adult-sized high chair, bibs, and numerous baby bottles in the kitchen. Downstairs, Tommy's bedroom features a large crib with a view of the Bay area, a collection of adult-sized baby clothes, and a trail of toys leading to a train set that fills the center of an adjacent room.

Diaper Pail Friends is about 15 years old, and grew from about 1,000 members in 1990 to more than 3,000 in 1995. Most of the members discovered the group through articles in magazines or books, television talk shows, or an Internet newsgroup. The club publishes a newsletter, short stories, videos, and distributes adult-sized baby paraphernalia.

A group of sexologists conducted an extensive survey of the Diaper Pail Friends, but had not yet published their findings as of 1995. Tommy, however, concluded from an informal survey of the group's members that

Even a casual review of infantilists in the DPF Rosters show that there are tremendous differences between one infantilist and another. In fact, there would seem to be as many personal, individual variations as there are people. Nevertheless, certain patterns do seem to become evident, patterns that seem to encompass a very large percentage of the environmental and inborn factors that are involved with the creation of Infantilism in human personality. These patterns are [in order of prevalence] (1) deficient early nurturing, (2) rejection of Softness, (3) childhood sexual abuse [primarily in female members], and (4) bed wetting. Every infantilist probably has one or more of these patterns in their history, and each infantilist combines them in varying degrees. The variations are limitless. (Tommy 1992)

A Chicago-based national acrotomophile club (people aroused by seeing amputees) has a membership of about 300. They sponsor an annual conference during the first week of June and have spawned local chapters that also hold meetings. Quarterly pamphlets are sent to members and a couple of Internet newsgroups exist. New membership is not aggressively recruited, but the number of self-identified acrotomophiles has increased since the 1989 publication of Grant Riddle's book, *Amputees and Devotees*, which examines the psychological basis of this phenomenon.

According to Riddle, many "devotees" are aware of this preference as a child, but there seems to be a wide variety of reasons for its development. One of these is being overly criticized by parents and wishing to be like a handicapped neighbor, assuming this would relieve some of the pressure. Another cause is being taught that sex is dirty, and from there, having to rationalize that if one cares for someone handicapped, one can justifiably ask for sex in return. Activities of acrotomophiles include having a healthy partner pretend to limp or use crutches; most acrotomophiles, however, content themselves with viewing photos (mostly of clothed females) or possibly catching a glimpse of an amputee on the street (Riddle 1989).

Autoerotic asphyxia (self-strangulation) seems originally to have been carried to Europe by French Foreign Legionnaires returning from war in Indochina (Michaldimitrakis 1986). Erotic asphyxia involves using a pillow, gag, gas mask, latex or leather hood, plastic bag, or other object to block oxygen intake. It may also involve strangulation by a partner's hands, or with a scarf or Velcro blood-pressure cuff. Corseting of the waist is another less obvious method of impeding oxygen intake.

This practice takes the lives of an estimated 250 to 1,000 Americans each year. It is believed that many more people experiment with asphyxia safely alone and/or with a partner, but because this act carries great legal liability if things go wrong, it is impossible to estimate the number of people

who engage in it. During the early 1990s, a Seattle man made an effort, through workshops and lectures, to teach safety techniques to practitioners. Although he found many interested parties, he had to limit his public appearances and advice because of legal concerns.

Although there is little information available about the asphyxiphile's childhood, John Money has described one case in his book, *Breathless Orgasm*. This subject recalled first becoming interested in asphyxia when his childhood sweetheart drowned. He began by thinking of her drowning experience and soon discovered he was becoming aroused by visualizing her nude body under water and thinking about her suffocating (Money et al. 1991).

Another asphyxiphile, who related his experience to the audience at a San Francisco lecture on the subject, described being raised as a Jehovah's Witness and taught that masturbation was a sin. This did not deter him from engaging in masturbation, but rather made it much more exciting, because he felt he could be "struck by lightning." After giving up his religious practice in his late teens, he immediately discovered that masturbation lost its intensity. He then found that by putting himself in a life-or-death situation, i.e., asphyxia, he could recover this lost intensity.

Most data on asphyxiphiles have been collected from the death scene of the victims. Ray Blanchard and Stephen J. Hucker have collected a vast data bank of coroner's reports and other materials on the subject. In their study of 117 incidents, they discovered that older men

were more likely to have been simultaneously engaged in bondage or transvestitism, suggesting elaboration of the masturbatory ritual over time. The greatest degree of transvestitism was associated with intermediate rather than high levels of bondage, suggesting that response competition from bondage may limit asphyxiators' involvement in a third paraphilia like transvestitism. (Blanchard et al. 1991).

Sexual asphyxia is rarely depicted in print media, but has been shown in a few films, such as the 1993 movie, *The Rising Sun*, and also in the 1976 French-Japanese movie, *In the Realm of the Senses*.

Chubby Chasers, a San Francisco club of men attracted to the obese, almost doubled in membership between 1990 and 1995 and grew to include 50 different international groups. This club was involved on the Internet early and recruited many of its members there. This club also staffs a booth at the annual San Francisco Lesbian and Gay Freedom Day Parade. Membership in the organization includes a newsletter and invitation to many social activities. Many, but not all, "chasers" had a parent or close relative who was very obese, and recall having a preference for "chubbies" when they were as young as 4 or 5. For those with this interest, there are full-color commercial magazines depicting obese nude females, sometimes with a slender male partner, available in adult book stores.

There are a number of food fetishists or "piesexuals," a word coined by a well-known pie enthusiast, Mike Brown, who began his affair with pies at age 13. Mr. Brown produces pie videos and also hosts annual "bring your own pie" throwing parties, where couples undress and hit each other with pies. There is an Internet newsgroup and also several clubs catering to this interest. *Splash* magazine, although not sexual, features attractive females smeared with an assortment of food and mud, another messy fetish.

Other more obscure fetish/paraphilia organizations include WES (We Enjoy Shaving) of Reno, Nevada; the Wisconsin STEAM journal for agoraphiles, who enjoy engaging in sex in public; and Hot Ash, a New York club for peo-

ple aroused by partners who smoke. Hot Ash publishes a newsletter and sells videos for those with this interest.

New York is also the home of a vampire sex club whose members make small cuts on others and rub or lick the blood off. Blood sports are also common among some SM practitioners in the forms of caning, cutting, or piercing. San Francisco had coprophilia (feces) and urophilia (urine) clubs before the AIDS epidemic. Some of the newest groups include Fire Play, whose members drip hot wax on their partners, rub lit cigarettes on their bodies, and/or use chemical irritants. Some with this interest rub a small part of the body with diluted alcohol and ignite it.

In another new paraphilic activity, some men catch bees and use them to sting the penis. The venom not only doubles the size of the penis for a few days, but also seems to bring about a change in the neural system that enhances the arousal stage.

The foregoing are but a few of the many unorthodox sexual practices now being pursued in the United States. Many more exist, and new ones are being invented all the time. And thanks to technology, including the Internet, advances in the quality and availability of home-based desktop publishing, and the rise of sensationalist television talk shows, interest and participation in these activities is on the increase.

In the coming years, the continuing growth of fetish/paraphilia sex groups will require therapists to learn to make clear determinations among people who experiment with various activities, those who self-report to have a fetish but five years later become bored with it, and the few clinically defined paraphiles who truly need some type of intervention or treatment.

## 9. Contraception, Abortion, and Population Planning

PATRICIA BARTHALOW KOCH

[*Comment 1997:* In the final sections of this review of sexuality in American culture, we consider several areas which are concerned with health and/or technology. The areas of contraception, abortion, and sexually transmitted disease each have rather obvious health implications, but each is also influenced by growing medical technology and illustrates a relationship between sexual conduct and technological advances. We would note that the question of effective social policy in each of these areas remains a matter of considerable social conflict within the U.S.A. The identification and treatment of sexual “dysfunctions” reflect these same concerns. In fact, the growing recognition that various sexual conditions can be diagnosed and treated, and the growing public acceptance of the legitimacy of such treatment, may be one of the more profound, if subtle, changes in American sexuality in the last century. In no small way, this process has served to fuel the growth of an array of sexual professions, with a corresponding need to provide graduate education for such professionals and the emergence of professional organizations. We provide a brief review of each of these professional developments. Finally, we close with a series of reviews on American popular culture, each enabled to some degree by technological developments, which both reflect and influence sexual information and communication about American sexuality. Some mention of this was already made earlier in the section on fetishes and paraphilias (see Section 8D, Significant Unconventional Sexual Behaviors). As always seems to be the case with sexual issues within the U.S.A., they all have generated a fair amount of political activity and social conflict. (*End of comment by D. L. Weis*)]

## A. Contraception PATRICIA BARTHALOW KOCH *A Brief History*

“The struggle for reproductive self-determination is one of the oldest projects of humanity; one of our earliest collective attempts to alter the biological limits of our existence” (Gordon 1976, 403). Throughout U.S. history, as elsewhere, many have been desperate to learn safe and effective ways to prevent conception and induce abortion, while others have believed artificial contraception is unacceptable because it interferes with the course of nature.

Brodie (1994) conducted a historical analysis of efforts for reproductive control in colonial and 19th-century America. New England fertility rates in colonial times were higher than those in most of Europe. Colonists had little real ability, and perhaps little will, to intervene in their reproduction. It has been estimated that one third of the brides of this time were pregnant. Although the Puritans viewed marriage with children as the highest form of life, the prevalence of premarital pregnancy was not viewed as a threat to this value, because virtually all such pregnancies led to marriage (Reiss 1980).

On the other hand, Native Americans seemed to possess knowledge and cultural practices—breastfeeding, periodic abstinence, abortion, and infanticide—specific to their particular tribes, enabling them to maintain small families. Fertility among the African and Caribbean women brought as slaves varied widely, depending on the region of the United States—in some places, fecundity reaching human capacity and in other places, fertility rates decreasing. According to Brodie (1994, 53): “Fecundity assured slave women that they were valuable to the master and offered some hope against being sold. Yet preventing the birth of new slaves for the master could be a form of resistance to slavery.”

The three most common forms of birth control during this time were coitus interruptus (withdrawal), breastfeeding, and abortion. The effectiveness of breastfeeding in preventing another pregnancy depended on how long the woman breastfed, on when her menstruation resumed after childbirth, and on how long and how often the infant suckled. However, by the 19th century, the option of bottle-feeding infants was becoming more available and popular.

Abortion methods included violent exercises, uterine insertions, and the use of drugs. These methods may have been no more dangerous than the pregnancy and childbirth complications of the time, but it has been suggested that these methods were also a common cause of death for women. American folk medicine was evolving from the knowledge and indigenous practices of the Native Americans, European settlers, and African/Caribbean slaves. Many abortifacients were made from plants, such as pennyroyal, tansy, aloe, cohosh, and squaw root. Such “remedies” were often passed down through family Bibles and cookbooks. Over 1,500 medical almanacs, many containing herbal remedies to “bring on a woman’s courses,” were circulated before the American Revolution. Yet there was little public discussion of birth control and no laws or statutes governing information or practice.

Brodie documents that reproductive control during most of the 19th century in America was neither rare nor taboo. Information was available about withdrawal, douching (the “water cure”), rhythm (although the information was not very accurate), condoms, spermicides, abortion-inducing drugs, and early varieties of the diaphragm. When other contraceptive options were available, couples seemed to prefer them over withdrawal; sexual abstinence was not one of the chief means of controlling birthrates. Abortion was not illegal until “quickening” (movement of the fetus).

Beginning in the 1830s, reproductive control became a commercial enterprise in the expanding American market economy. Douches and syringes, vaginal sponges, condoms, diaphragms (or “womb veils”), cervical caps, and pessaries (intra-vaginal and intrauterine devices) began to be widely advertised through a burgeoning literature on the subjects of sexuality and reproductive control, euphemistically called “feminine hygiene.” Education through this means was made possible by the technological improvements in printing and the increased basic literacy of the American public.

The self-help literature instructed readers on how to make contraceptive and abortion agents at home from products readily available in the household or garden. Douching was the most frequent method for reproductive control used by middle- and upper-class women. The invention of the vulcanization process for rubber by Goodyear in the 1840s enabled condoms to be made more cheaply. In addition, the appearance of the mail-order catalog allowed the public to “shop” for contraceptive devices confidentially.

The birthrate of white native-born married women was reduced almost by half between 1800 and 1900, coinciding with the major social upheaval of industrialization and urbanization. Many American couples wanted fewer children and greater spacing between them. This became possible with the evolving availability of information about and access to more-effective contraceptive techniques.

By the mid-1800s, the abortion rate among the white middle class increased sharply with greater access to diverse sources of information about abortion, abortion drugs and instruments, and persons offering abortion services. There was little outcry about abortion being “immoral” until the American Medical Association launched a campaign to curb it at mid century. Historians have debated whether the new opposition to abortion by male physicians was more because of the threat of competition from female midwives or to a concern about the dangers of unsafe abortion.

As reproductive control became commercialized after 1850, and as some women became increasingly able to assert a degree of independent control over their fertility through contraception and abortion, the deep ambivalences with which many Americans regarded such changes came increasingly into play. In the second half of the 19th century, diverse groups emerged to try to restore

American “social purity,” and one of the issues they focused on was restricting sexual freedom and control of reproduction. . . . All branches of government were their allies; their goals were won through enactments of federal and state legislation and sustained by judicial decisions that criminalized contraception and abortion, both of which had in earlier decades been legal. (Brodie 1994, 253)

Laws began to alter 200 years of American custom and public policy towards contraception and abortion. Federal and state laws made it a felony to mail products or information about contraception and abortion. Such materials were then labeled “obscene.” In 1873, Congress passed “The Act for the Suppression of Trade in, and Circulation of Obscene Literature and Articles of Immoral Use,” which tightened the loopholes on interstate trade and importation of birth-control materials from abroad. This law was better known as the Comstock Law, named after Anthony Comstock, a leading “social purity” proponent and crusader against “obscenity.” Comstock was even appointed a special agent of the U.S. Post Office and allowed to inspect and seize such “illegal” material until his death in 1915.

The combined force of the social purity legions and of overwhelming public acquiescence overrode a generation

of commercialization and growing public discourse and drove reproductive control, if not totally back underground, at least into a netherworld of back-fence gossip and back-alley abortion. (Brodie 1994, 288)

The Comstock Law would stand until a federal appeals court would overturn its anticontraceptive provisions in 1936 (*United States v. One Package*) on the grounds that the weight of authority of the medical world concerning the safety and reliability of contraception was not available when the law was originally passed. (The anti-obscenity provisions of the Comstock Law remained intact for several more decades.)

What is referred to as “the birth-control movement” was begun in the United States shortly before World War I, primarily by socialists and sexual liberals as both a political and moral issue. Margaret Sanger’s leadership, in the early 1900s, was responsible for gaining support from mainstream America and centralizing the cause through her American Birth Control League. Sanger attributed her indomitable dedication to making birth-control information and methods available to American women, particularly of the working class, to her nursing experiences with poor women during which they would beg her to tell them the “secrets” of the rich for limiting children.

In 1915, she began publishing *Woman Rebel*, a monthly magazine advocating birth control. She was indicted for violating the Comstock Law, but the case was dropped and she continued dispensing birth-control information through lectures and publications. In 1916, she was arrested again for opening the first birth-control clinic in the United States in a poor slum in Brooklyn, New York. She served 30 days in jail; however, the testimonials of her poor birth-control clients at the trial helped to fuel the birth-control movement.

Gordon (1976) documents the birth-control movement throughout the 20th century in the United States. In the early 1920s, most doctors were opposed to contraception. However, through the efforts of Margaret Sanger and Dr. Robert Latou Dickenson, contraception was scientifically studied and became accepted as a health issue, not simply a moral one. Clergy, particularly of the Protestant and Jewish faiths, also began to view contraceptive choice as an individual moral decision when it affected the health of a family. To this day, however, the Catholic Church has remained staunch in its opposition to “artificial birth control.” Yet, this opposition has not deterred Catholic women in the United States from using birth-control methods as frequently as women of other or no faiths.

The Great Depression of the 1930s forced many more Americans into accepting and practicing birth-control measures. Social workers, based on their interactions with many poor and struggling families, became proponents in support of better education about, and access to, birth control for all women, not just the middle class and wealthy. The manufacturing of condoms became a large industry. In the 1930s, with the formation of the American Birth Control League, over 300 clinics throughout the United States were providing contraceptive information and services; this increased to more than 800 clinics by 1942.

Yet, despite the fact that a 1937 poll indicated that 79% of American women supported the use of birth control, those who did not have access to private doctors were limited in their access to birth-control information and devices. However, judges, doctors, government officials, entrepreneurs, and others were beginning to respond to grassroots pressure. For example, in 1927, the American Medical Association officially recognized birth control as part of medical practice. In 1942, Planned Parenthood Federation of America

(PPFA) was founded with a commitment to helping women better plan family size and child spacing. PPFA was greatly responsible for making birth control more accessible to women of various backgrounds, particularly those of lower socioeconomic levels, throughout the United States.

### *Development of the Oral Contraceptive Pill and IUD*

During the 1950s, research was progressing in the United States that would transform contraceptive technology and practice worldwide. Asbell (1995) details the biography of the “drug that changed the world.” The quest for a female contraceptive that could be “swallowed like an aspirin” began when Margaret Sanger and Katherine McCormick, a wealthy American woman dedicated to the birth-control movement, enlisted Gregory Pincus, an accomplished reproductive scientist, to develop a contraceptive pill. Applying the basic research findings of others, particularly Russel Marker, who produced a chemical imitation of progesterone from the roots of Mexican yam trees, Pincus developed just such a pill combining synthetic estrogen and progesterone.

With the help of John Rock, a noted Harvard gynecologist and researcher, the oral contraceptive was initially given to 50 Massachusetts volunteers, and then field tested with approximately 200 women in Puerto Rico in 1956, where it was believed opposition to such a drug would be less than in the United States. However, the pill was heartily condemned by the Catholic Church, leaving Puerto Rican women to face the dilemma of choosing to be in the trials (and committing a mortal sin) or bearing more children that they could not adequately support. In addition, the standards for informed consent for research subjects were not as strict as they are today, so that participants in these trials were not thoroughly informed as to the experimental procedures being used and the potential risks involved (which were generally unknown).

In 1957, the pill was first approved by the Food and Drug Administration (FDA) for treatment of menstrual disorders. At this time, it was observed that many women who had never before experienced menstrual disorders suddenly developed this problem and sought treatment with the pill. By 1960, the pill was formally approved by the FDA as a contraceptive following double-blind clinical trials with 897 Puerto Rican women. Such a procedure would well be considered ethically questionable today.

The pill was extremely attractive to many potential users because of its convenience and efficacy. Women now had the option of engaging in intercourse with minimal threat of pregnancy. This method separated the act of coitus from the action taken to restrict fertility (ingestion of the pill). In addition, the woman was in sole charge of this method of birth control and did not need any cooperation from her male partner. Many believed this innovation in birth control was responsible for a “sexual revolution” in which women were to become more “sexually active,” displaying patterns of sexual attitudes and behaviors more like men, although there is little scientific evidence to support this claim. As Ira Reiss explained the evolutionary changes taking place in American sexual expression:

Sexual standards and behavior seem more closely related to social structure and cultural and religious values than to the availability of contraceptive techniques . . . [increased premarital sexuality] was promoted by a courtship system that had been evolving for a hundred years in the United States permitting young people to choose their own marriage partners, and which therefore encouraged choice of when as well as with whom to share sex. (Asbell 1995, 201)

By 1967, the Population Council estimated that 6.5 million women were using the birth-control pill in the U.S., while 6.3 million women were using it in other parts of the world. Some were concerned as to whether millions of women were serving as guinea pigs in a massive experiment, since careful large-scale studies of its safety had not been conducted before it was marketed (Seaman 1969). Disturbing side effects, including deep-vein thrombosis, heart disease and attacks, elevated blood pressure, strokes, gallbladder disease, liver tumors, and depression, were being reported. In the first few years of use in the U.S., more than 100 court claims were filed against its manufacturer. Some countries, including Norway and the Soviet Union, banned the pill. Some American women mobilized to create a women’s health movement, spearheaded by the National Women’s Health Network, to help the public become better informed about the benefits and risks of pill use, as well as other medical procedures and drugs. Yet, accurate information about the benefits and risks of pill use was often unavailable, difficult to access, and distorted and sensationalized. In the 1970s, pill sales dropped 20%.

Twenty-five years later, oral contraception has become one of the most extensively studied medications ever prescribed. Today, pills with less than 50 micrograms of estrogen are associated with a significantly lower risk of serious negative effects and are as effective in preventing pregnancy as the higher-dose pills of the past (Hatcher et al. 1994).

The intrauterine device (IUD) also became popular in the United States as the “perfect” alternative to the pill because of its effectiveness and convenience. However, the Dalkon Shield, which was marketed from 1971 to 1975, was implicated in a number of cases of pelvic inflammatory disease and spontaneous septic abortions resulting in the deaths of at least 20 women. In 1974, the Shield was taken off the U.S. market, although it was still distributed abroad. Currently, there are only two IUDs for sale in the United States, the TCu-380A (ParaGard) and the Progesterone T device (Progestasert).

### *Government Policy and Legal Issues*

While research was expanding birth-control options, the 1950s and 1960s saw the development and implementation of federal policies supporting population control programs designed to deal with overpopulation throughout the world. Birth control was offered as a “tool” for economic development to Third World countries. The 1960 budget of \$2 million for family-planning programs grew to \$250 million in 1972 (Asbell 1995). However, American goals were often in conflict with the cultural beliefs of the people in various countries. Reproductive options cannot be separated from the economic options and social mores of a culture.

Governmental policies on birth control were also changing at home. In 1964, President Lyndon B. Johnson, over strong political opposition, provided federal funds to support birth-control clinics for the American poor. These efforts were continued by President Richard M. Nixon, who in 1970 declared “a new national goal: adequate family-planning services within the next five years for all those who want them but cannot afford them” (Asbell 1995).

Important legal changes were also occurring in the U.S. during this time. In 1965, the Supreme Court decided, in *Griswold v. Connecticut*, that laws prohibiting the sale of contraceptives to married couples violated a constitutional “right of privacy.” Writing the majority opinion, Justice William O. Douglas declared:

we deal with a right of privacy older than the Bill of Rights—older than our political parties, older than our

school system. Marriage is a coming together for better or worse, hopefully enduring and intimate to the degree of being sacred. (Asbell 1995, 241)

The court asked, "Would we allow the police to search the sacred precincts of marital bedrooms for telltale signs of the use of contraceptives?" The judges responded, "The very idea is repulsive to the notions of privacy surrounding the marital relationship."

In 1972, the Supreme Court extended this "right to privacy" for contraceptive use to unmarried people (*Eisenstadt v. Baird*) on the basis that a legal prohibition would violate the equal protection clause of the 14th Amendment. A 1977 Supreme Court decision (*Carey v. Population Services*) struck down laws prohibiting the sale of contraception to minors, the selling of contraception by others besides pharmacists, and advertisements for or displays of contraceptives.

### Recent Developments in Birth Control

More-recent developments in contraceptive technology receive tougher scrutiny than in the past before winning FDA approval. For example, Norplant was developed by the international nonprofit Population Council, which began clinical trials including half a million women in 46 countries, not including the U.S.

However, Norplant was not approved for use in the United States by the Food and Drug Administration (FDA) until 1990. This approval was opposed by the National Women's Health Network because the long-term safety of Norplant had not been established. Wyeth-Ayerst, the U.S. distributor, is required by law to report any unusual events associated with Norplant use to the FDA, while an internationally coordinated surveillance of Norplant use and its effects is being conducted by the World Health Organization and others in eight developing countries. Currently, a class-action suit is being formulated by a group of Norplant users in the U.S., primarily because of the difficulties they experienced in having the Norplant rods removed. Such complications are a serious impediment keeping American pharmaceutical companies from researching and developing new contraceptives.

Depo-Provera (Depo-medroxyprogesterone acetate or DMPA) is the most commonly employed injectable progestin used in over 90 countries worldwide. However, it was not approved for use in the U.S. by the FDA until 1992. Women's health activists, organized by the National Women's Health Network, had opposed its approval in the absence of more long-term studies of its safety.

In 1993, the FDA approved the first female condom, called Reality, for over-the-counter sale in the United States. The female condom, or vaginal pouch, is a polyurethane lubricated sheath that lines the vagina and partially covers the perineum. Although the method failure rate of the female condom (5%) is similar to that of the male condom (3%), it has a higher failure rate with typical use (21%) than does the male condom (12%) (Hatcher et al. 1994). This may reflect the "newness" of this female method and inexperience with its use. Yet, in a study of 360 women using female condoms, only 2 discontinued its use.

Although a combination of RU-486 (mifepristone) and prostaglandin has been tested in over a dozen countries, particularly in France, it has generated controversy in the U.S. and was only approved for use here in 1996. Because RU-486, when combined with a prostaglandin, is an effective early abortifacient, its use has been opposed by anti-abortion proponents, even for research purposes or its potential use in the treatment of breast cancer, Cushing's syndrome, endometriosis, and brain tumors. Because it was so politically controversial, RU-486 had not been expected to be ap-

proved for any use in the United States, which turned out not to be the case.

What is the future for the development of new birth-control methods in the United States? Contraceptive-vaccine researchers acknowledge that a new form of birth control for men is badly needed. Yet, it is believed that immunizing men against their own sperm would risk destroying the testes. However, researchers in the U.S. are talking with the FDA to test a vaccine with women that induces the woman's immune system to attack sperm. Previously, such vaccines have been tested on mice, rabbits, and baboons with an effectiveness rate of 75 to 80%.

In the past, Federal agencies have shied away from supporting such work because "right-to-lifer" advocates view such a vaccine as abortive and, therefore, unacceptable. In addition to the possibility of medical liability, American pharmaceutical companies are unlikely to market such a vaccine because of the protests and boycotts that "right-to-life" groups threaten to organize. Because of the threat of boycotts from adversarial groups and lawsuits from persons claiming to be harmed by new contraceptive technologies, only one American company remains active in contraceptive research and development. In the late 1960s, nine American drug companies were competing to find new and better birth-control methods.

### Current Contraceptive Behavior

Between 1988 and 1990, the proportion of women in the United States, from the age of 15 to 44, who had never had vaginal-penile intercourse declined from 12% to 9%. (Data used in this section are based on the 1982 and 1988 *National Survey of Family Growth (NSFG)* and the 1990 *NSFG Telephone Reinterview*) (Peterson 1995). The proportion of 15- to 44-year-olds who were at risk for unintended pregnancy but were not contracepting increased from 7% to 12%. This increase was most pronounced among 15- to 44-year-olds (8% to 22%), never-married women (11% to 20%), and non-Hispanic white women (5% to 11%).

In 1990, 34.5 million women, or 59% of those aged 15 to 44, in the United States were using some type of contraception—with almost three quarters (70.7%) of married women using contraception; see Table 17. There is little difference in contraceptive use based on religious background between Catholic, Protestant, and Jewish women. The leading methods used by contraceptors were female sterilization (29.5%), the contraceptive pill (28.5%), and the male condom (17.7%). (Information on the use of three newer methods—Norplant, the female condom, and Depo-Provera—was not available at the time of the surveys). Overall, the use of female and male sterilization, the condom, and periodic abstinence had increased from 1988, whereas the use of the pill, IUD, and diaphragm had decreased.

Female sterilization is most widely used among older and less-educated women who have completed their childbearing, with over one half (52.0%) of female contraceptors age 40 to 44 having been sterilized. Anglo-American women are much more likely to have male partners with a vasectomy (15.5%) than are African-American women (1.3%). The aging of the baby-boom generation in the United States portends a continued rise in female sterilization rates throughout the next decade and a rise in vasectomies among the better educated.

The increased use of the condom was most pronounced among young (aged 15 to 44), African-American, never-married, childless, or less-educated women, and those living below the poverty level. For example, condom use among never-married women tripled between 1982 and 1990 (4% to 13%). The percentage of adolescents using

**Table 17**

<sup>1</sup>Includes natural family planning and other types of periodic abstinence.

<sup>2</sup>Percentages for 1990 were calculated excluding cases for whom contraceptive status was not ascertained. Overall, contraceptive status was not ascertained for 0.3% of U.S. women in 1990.

Source: Peterson, L. S. (1995, February). "Contraceptive Use in the United States: 1982-1990." From *Vital and Health Statistics. Advanced Data No. 260*, Hyattsville, MD: National Center for Health Statistics.

condoms rose from 33% to 44% between 1988 and 1990. Almost all contracepting teenagers used either the pill (52%) or condom (44%) in 1990. However, it must be kept in mind that only 56% of condom users report using them consistently every time they have intercourse.

The use of contraception at first intercourse by adolescents has increased significantly since the early 1980s. For example, during 1980-1982, 53% of unmarried women aged 15 to 19 used contraception during their first intercourse experience. By 1988-1990, this percentage rose to 71%, mainly attributable to rising condom use (from 28% to 55%). The increase in condom use was particularly striking among Hispanic teens, with a threefold increase from 1980 to 1990 (17% to 58%).

Table 18 depicts the latest estimates of pregnancy prevention with typical use (indicating user failure) and perfect use (indicating method failure) among the contraceptive methods currently available in the United States (Hatcher et al. 1994). The most effective methods are Norplant, the oral

contraceptive pill, male and female sterilization, Depo-Provera, and IUDs.

[*A Contraceptive Revolution?* WILLIAM TAVERNER  
[Update 2003: In the seven years since Patricia Barthallow Koch prepared the above status report, major advances have been made in the availability of new contraceptive methods in the United States. From 2001 to 2002 alone, the U.S. Food and Drug Administration (FDA) approved six new contraceptive methods. Some have celebrated the new options as indicative of a “contraceptive revolution”; others have questioned how “new” the methods really are. Andrea Tone, for instance, comments that, rather than being truly innovative, many of the “new” methods are little more than repackaging of old technologies (Tone 2002-2003). For example, the widely advertised contraceptive patch uses the same fundamental hormonal technology as “the pill,” “the shot,” or any other mode of entry to the body.

[New methods introduced to the American public since 1997 include:

- *Essure*, a new type of female sterilization without incision. A “micro-insert” is placed in each fallopian tube, facilitating local tissue growth that serves as a barrier (Conceptus).
- *Lea’s Shield*, a cup-shaped cervical cap designed to cover the cervix without being held in place by the cervix (U.S. Food & Drug Administration).
- *Lunelle*, a monthly hormonal shot, and an alternative to Depo Provera, an injection given every three months (Hatcher et al. 2003).
- *Male polyurethane condoms* became commercially available in 1997 (Brick & Taverner 2001). Two male polyurethane condoms are marketed in the United States, Avanti by Durex and Supra by Trojan, providing a condom alternative for people with latex allergies.
- *Mirena*, a hormonal intrauterine device effective for 10 years (Hatcher et al. 2003).
- *NuvaRing*, a hormonal vaginal ring, inserted in the vagina for three weeks, and removed the week of menstruation (Hatcher et al. 2003).
- *Ortho Evra*, a transdermal hormonal patch usually worn on the lower abdomen or buttocks for one week, for each of three weeks, and not worn the week of menstruation (Hatcher et al. 2003).

[*Comings and Goings*. Other notable changes in contraceptive availability during the last several years involve the contraceptive sponge, implants, and spermicides. In 1995, the contraceptive sponge was removed from the market when the manufacturer decided to stop production, rather than make government-ordered changes to the manufacturing plant. The sponge regained popularity when an episode of the television sitcom, *Seinfeld*, featured a character who dealt with the impending loss of her favorite method by hoarding many boxes of the sponge, and then determining whether each potential sexual partner was “sponge-worthy.” In 1998, a pharmaceutical company purchased the rights to the sponge and anticipated FDA approval some time in 2003.

[Norplant, a six-rod hormonal implant system, was sold in the United States from 1991 until 2000. The method was FDA-approved for five years, but is possibly effective for up to seven years (Hatcher et al. 2003). Although Norplant is not available to new users, some women continue to use their previously implanted method; other women look forward to the

eventual marketing and availability of Jadelle, a two-rod implant system that received FDA approval in 1996 (Schwartz & Gabelnick 2002), and Implanon, a single implant effective for three years and currently available in several European countries (Hatcher et al. 2003).

[Research on nonoxynol-9, a spermicide found in contraceptive film, foam, jelly, sponges, and suppositories, has had many United States health organizations rethinking the extent to which they endorse such products. While nonoxynol-9 products continue to work with moderately high effectiveness as contraceptive methods, they may also exacerbate individuals' risk of HIV infection. Nonoxynol-9 may irritate the vaginal walls, causing lesions that could facilitate the transmission of HIV (Schwartz & Gabelnick 2002).

[Research has also clarified the effectiveness of coitus interruptus (withdrawal), a method whose failure has been traditionally overstated by American educators. Tests of its effectiveness show that it has a "perfect use" failure rate of 4% and a typical use failure rate of 27% (Hatcher et al. 2003). Still, its efficacy remains highly user-dependent, as effectiveness relies on the male's ability to predict ejaculation and withdraw in time.

[*For Emergency Use Only.* New forms of emergency contraception became available in the late 1990s, including the "Yuzpe Regimen" and "Plan B," a progestin-only method. Although they are sometimes confused with abortifacients, all methods of emergency contraception actually prevent pregnancy before it begins, and will not disturb an implanted pregnancy (Hatcher et al. 2003; Brick & Taverner 2003). Plan B is more effective and has fewer side effects (Brick & Taverner 2003). For several years, it was recommended that use of emergency contraception begin within 72 hours of unprotected vaginal intercourse; in 2002, the period was extended to 120 hours. However, the earlier the regimen is begun, the more effective it is. Recognizing that timing is of the essence, and that increased access to emergency contraception could greatly reduce the number of unplanned pregnancies every year, five states have enacted laws permitting the dispensing of emergency contraception without a prescription. These states include Alaska, California, Hawaii, New Mexico, and Washington (Alan Guttmacher Institute 2003). The 45 other American states still require a woman to visit a doctor or reproductive health center before emergency contraception may be dispensed.

[*A New Gag Rule.* Despite all the reliable, safe contraceptive methods available for sexually active teens, the United States government has championed abstinence as the contraceptive method of choice since 1996. Federal funding in excess of \$100 million supports "abstinence-only" education programs that forbid any discussion of the effectiveness of other methods. No research has indicated that such programs are effective in reducing teen sexual activity, or delaying the initiation of sexual intercourse (Kirby 2001). Nevertheless, in government-funded abstinence-only programs, American educators are unable to provide basic contraceptive information to teens, at least three quarters of whom have had intercourse by their late teens (Alan Guttmacher Institute 2002). Perhaps consequently, U.S. teens continue to experience pregnancy, birth, and abortion at rates much higher than most other industrialized nations (Moss 2003; Singh & Darroch 2000), despite similar levels of sexual activity between U.S. teens and teens in other developed nations.

[*Limited Coverage.* Half of American health insurance companies do not cover any reversible methods of contraception. Plans that do cover contraceptive methods often do

not cover all FDA-approved options. Twenty states require insurance companies to provide full contraceptive coverage, but 10 of these states allow employers offering health insurance not to offer contraceptive coverage for religious reasons. The other 30 states have no laws requiring that contraceptives be covered by insurers (Planned Parenthood Federation).

[*Who Is Using What?* Sixty million American women are in their reproductive years, age 15 to 44. Sixty-four percent of these women practice some method of contraception. Among women of reproductive age who use contraception, 61% use reversible methods, such as oral contraception and condoms, while the remaining 39% rely on male and female sterilization. Half of American women aged 40 to 44 have been sterilized, and an additional 20% have a partner who has had a vasectomy (Alan Guttmacher Institute 1999).

[Among younger Americans, condoms are becoming increasingly popular for their *first* act of intercourse. More than two thirds of teens use a condom at first intercourse; however, condom use fades among both men and women as they become older (Alan Guttmacher Institute 2002). By their late 20s, almost half of men and women rely on female methods (Alan Guttmacher Institute *Facts in Brief* 1999). Among teen females and women in their 20s, the most popular contraceptive method is the pill (Alan Guttmacher Institute 1999).

[Perhaps because of the political climate described earlier, the mindset of protection against *both* unplanned pregnancy *and* sexually transmitted infections has not caught on in the United States as it has in other developed nations. A "trade-off" is evident in American contraceptive decision-making, where individuals decide to focus exclusively on one aspect of protection, but not on both (Ott et al. 2002; Taverner 2003). Consequently, one in four sexually active U.S. teens has a sexually transmitted infection (STI/STD), and scores of millions of Americans are infected with a viral STI (SIECUS; CDC). (*End of update by W. Taverner*)

## B. Childbirth and Single Women

PATRICIA BARTHALOW KOCH

Each year, one million American teenage girls become pregnant, a per-thousand rate twice that of Canada, England, and Sweden, and ten times that of the Netherlands. A similar disproportionately high rate is reported for teenage abortions (Jones et al. 1986).

The birthrate for unmarried American women has surged since 1980, with the rate for white women nearly doubling, and the rate for teenagers dropping from 53% of the unwed births in 1973, to 41% in 1980, and 30% in 1992. One out of every four American babies in 1992 was born to an unmarried woman. The unwed birthrate rose sharply for women 20 years and older. The highest rates were among women ages 20 to 24 (68.5 births per 1,000), followed by 18- and 19-year olds (67.3 per 1,000) and 25- to 29-year-olds (56.5 per 1,000). Overall, according to a 1995 report from the National Center for Health Statistics, the unmarried birthrate rose 54% between 1980 and 1992, from 29.4 births per 1,000 unmarried women ages 15 to 44 in 1980 to 45.2 births per 1,000 in both 1991 and 1992 (Holmes 1996a).

In 1970, the birthrate for unmarried black women was seven times the rate for white women, and four times the rate for white women in 1980. Since 1980, the white unmarried birthrate has risen by 94% while the rate for blacks rose only 7%. By 1992, the birthrate for single black women was just 2.5 times the rate for white women. In 1992, the out-of-wedlock birthrates were 95.3 for Hispanic women, 86.5 for black women, and 35.2 for white women (Holmes 1996a).

Commenting on the social implications of these statistics, Charles F. Westoff, a Princeton University demogra-

pher, said they “reflect the declining significance of marriage as a social obligation or a social necessity for reproduction.” Poorly educated, low-income teenage mothers and their children are overwhelmingly likely to experience long-term negative consequences of early childbearing as single parents (Associated Press News Release, June 7, 1995). A 1996 study, sponsored by the charitable Robin Hood Foundation, estimated the public cost of unwed teenage pregnancy at \$7 billion. The study looked at the consequences for teenage mothers, their children, and the fathers of the babies, compared with people from the same social background when pregnancy was delayed until the woman was 20 or 21. The breakdown of annual costs included \$2.2 billion in welfare and food-stamp benefits, \$1.5 billion in medical-care costs, \$900 million in increased foster-care expenses, \$1 billion for additional prison construction, and \$1.3 billion in lost tax revenue from the reduced productivity of teenage women who bear children (Holmes 1996a).

At the present rate, something like 50% or more of America’s children will spend at least part of their childhood in a single-parent family. About half of this number will be the result of divorce or separation; the rest will be born to a mother who has never been married (Luker 1996).

In any given year, roughly 12% of American infants are born to teenage mothers. However, the vast majority of these teenage mothers are 18 or 19 years old, and thus only technically teenagers. American teenagers have been producing children at about the same rate for most of the 20th century. Fewer than a third of all single mothers are teenagers, even when we include the 18- to 19-year-olds. And this proportion is declining. What is different in recent decades is that increasing numbers of teenage mothers are unmarried when they give birth. In 1970, only 30% of teenage mothers had never been married; by 1995, 70% of teenage mothers had never been married (Luker 1996).

While there is no good reason to suppose that the teenage birthrate is going up in any significant way—it was, in fact, higher in the 1950s—one must admit that the rate of single parenting is going up. In 1947, virtually all single mothers were widows, or living apart from their mate after separation or divorce. In 1947, fewer than one in 100 had never been married. Today, overall, never-married single mothers account for one in three, and the percentage is rising. The number of single teenage mothers is going up at a rapid rate, but so is the number of single mothers at every age.

These data suggest that we are participants in, or at least witness to, an important shift in the nature of American family life that is echoing throughout the industrialized world. According to Luker (1996), the last years of the 20th century may turn out to be the beginning of a time when the very notions of childrearing on the one hand and family life on the other are increasingly disconnected. While the rate of out-of-wedlock births is clearly on the way up, the rate of marriage may be declining, and the age of first marriage is clearly being delayed. In 1995, 60% of American families were headed by a single parent, half of them never-married. Luker (1996) suggests two possible outcomes. The present situation may prove to be only a temporary deviation from a stable pattern of long standing. Or it may mark the first hesitant appearance of an important new pattern.

If the latter interpretation turns out to have substance, one can ask why this is happening. Luker cites several influential shifts in social attitudes and behavior. First, “illegitimacy” has lost its moral sting. Second, many women are realizing that they do not need to put up with the abuse, domination, and other burdens they associate with married life. This has special resonance for women in poverty, who ask why they should live with a male who is unreliable and has

no skills or job. Third, although welfare benefits are declining throughout the industrialized world, teenage pregnancies are on the rise regardless of the level of welfare benefits. Finally, the vast majority of teenage pregnancies are unintended and not linked with the availability of welfare aid.

So long as teenagers are sexually active, the most effective way to reduce the incidence of childbearing is to assure that they have access to contraception before the fact, and abortion, if needed, after the fact. The many Americans who oppose sexuality and contraceptive education in the schools, distribution of contraceptives in schools, and abortion can only hope that someone discovers a way to reduce teenage sexual activity itself. That seems unlikely, given the decreasing age of puberty among American youth, the declining age of first sexual intercourse, and the clear trend to delay marriage well into the 20s or even 30s. Admonitions to “Just say ‘No’” are scarcely going to suffice as a workable national policy. In analyzing the politics of teenage pregnancy and single mothers in the United States, Kristin Luker (1996) concluded that:

Americans have every right to be concerned about early childbearing and to place the issue high on the national agenda. But they should think of it as a *measure*, not a cause, of poverty and other social ills. A teenager who has a baby usually adds but a slight burden to her life, which is already profoundly disadvantaged. . . . Early childbearing may make a bad situation worse, but the real causes of poverty lie elsewhere.

#### [Factors in a Falling Birth Rate

ROBERT T. FRANCOEUR

[Update 2003: America’s birthrate fell to a record low in 2002 as teenagers and women in their prime childbearing years had fewer babies, according to June 25, 2003, statistics from the Health and Human Services Department. The birthrate was 13.9 per 1,000 people in 2002, compared with 14.1 for 2001. This most recent figure is the lowest in government records that go back to the turn of the 20th century. A major factor in the decline has been the reduction in births by teenagers; other factors in this decline include the aging of the population, the fact that women in their prime childbearing years have been choosing to have fewer children, and the fact that, as the population ages, there are fewer women in their 20s and 30s.

[However, the percentages of premature and low-birth-weight babies continued to rise, as they did throughout the last decade of the 20th century. Twelve percent of births in 2002 were premature, compared with 11.9% in 2001. In addition, 7.8% were listed as low-birthweight, the highest level in 30 years. These increases came despite greater access to prenatal care. In 2002, 83.8% of women began receiving care in the first trimester of pregnancy, compared with 83.4% in 2001 and 75.8% in 1990. The birthrate for unmarried women declined, but this group still accounted for more than one third of all births. (End of update by R. T. Francoeur)]

#### [C. Condom Distribution in the Schools

ROBERT T. FRANCOEUR

[Update 1998: Seventy-two percent of American high school seniors, on average, have engaged in sexual intercourse, although the percentage is higher for teenagers in large cities and their suburbs. At the same time, American teenagers have the highest rate of teenage pregnancy and abortion in North America and Europe. They are also rapidly becoming the highest risk group for HIV/AIDS infec-

tion in the United States. American parents, educators, and healthcare professionals are consequently struggling to decide on ways to deal with this reality. Typical of the conflicted, schizophrenic American approach to sexual issues, religious conservatives call for teaching abstinence-only education and saying nothing about contraceptives and other ways of reducing the risk of contracting sexually transmissible diseases and HIV infections. At the same time, others advocate educating and counseling: "You don't have to be sexually active, but if you are, this is what you can do to protect yourself." However, the problem is so serious in New York, Baltimore, Chicago, Los Angeles, San Francisco, Philadelphia, Miami, and other large cities, that school boards in these cities now allow school nurses and school-based health clinics to distribute free condoms to students, usually without requiring parental notification or permission (Guttmacher 1997; Richardson 1997).

[Typical of the opposition is Dr. Alma Rose George, president of the National Medical Association, who opposes schools giving condoms to teens without their parents knowing about it: "When you give condoms out to teens, you are promoting sexual activity. It's saying that it's all right. We shouldn't make it so easy for them." Faye Wattleton, former president of the Planned Parenthood Federation of America, approves of schools distributing condoms, and maintains that "mandatory parental consent would be counterproductive and meaningless." Some critics claim that condom distribution programs are inherently racist and a form of genocide because the decisions are mostly made by a white majority for predominantly black schools.

[Recently, a study comparing the sexual activity and condom use of 7,000 students in New York City high schools, and 4,000 similar high school students in Chicago, supported the effectiveness of school condom distribution (Guttmacher 1997). The New York schools combined HIV/AIDS education with free condoms, while the Chicago schools had similar HIV/AIDS education but no condom distribution. In both cities, 60% of the students were sexually active regardless of whether or not their schools distributed condoms. However, students in schools that distributed condoms were significantly more likely to have used a condom in their last intercourse than teens in schools that did not distribute condoms. Regardless of the data available on the ineffectiveness of abstinence-only education and the effectiveness of condom distribution, this debate will continue. (End of update by R. T. Francoeur)]

## D. Abortion PATRICIA BARTHALOW KOCH

In America today, it seems that two camps are at war over the abortion issue. "Pro-choice" supporters advocate the right of the individual woman to decide whether or not to continue a pregnancy. They contend that the rights of a woman must take precedence over the "assumed" rights of a fertilized human egg or fetus. They believe that a woman can never be free unless she has reproductive control over her own body. Pro-choice advocates in the United States include various Protestant and Jewish organizations, Catholics for Free Choice, Planned Parenthood, the National Organization for Women (NOW), National Abortion Rights Action League (NARAL), and the American Civil Liberties Union (ACLU), among others.

Anti-abortion groups have politically identified themselves as "pro-life" supporters of "the right to life" for the unborn. This coalition involves such constituents as Eastern Orthodox, charismatic and conservative Roman Catholics, fundamentalist Protestants, and Orthodox Jews in influential groups like Operation Rescue, Focus on the Family, and the Christian Coalition. These groups use various methods

in order to prevent women from being able to have abortions, including, in some cases, personal intimidation of abortion providers and clients and political action.

The basic motivation of the protection of human life of those in the anti-abortion movement has, however, been questioned. For example, an analysis of the voting records of U.S. senators who are anti-abortion advocates indicates that they had the lowest scores on votes for family-support issues, bills for school-lunch programs, and for aid to the elderly (Prescott & Wallace 1978).

### [Abortion—The 25th Anniversary of the

*Roe v. Wade Decision* PATRICIA BARTHALOW KOCH

[Update 1998: A 1998 report on the status of abortion rights in the United States documents that there are more obstacles today for women seeking their constitutional right to abortion than ever before since the Supreme Court's *Roe v. Wade* decision in 1973 (NARAL 1998). The report documents the increasing risk of unintended pregnancy, with concomitant increasing difficulties in obtaining abortions, resulting in increased risks to women's health and well-being. The factors contributing to this include increased anti-abortion legislation enacted at the state and federal levels, an acute shortage of medical providers being trained in abortion procedures in medical schools, a parallel shortage of medical providers willing to contend with constant harassment from anti-choice activists, lack of sexuality education, and denial of insurance coverage for contraception. As Chief Justice William Rehnquist stated in the Supreme Court's *Planned Parenthood v. Casey* decision, "Roe continues to exist but only in the way a storefront on a western movie exists: a mere facade to give the illusion of reality" (*Planned Parenthood of Southeastern PA v. Casey* 1992).

[In 1998, states were enforcing an unprecedented number of abortion restrictions, including: mandatory waiting periods, Medicaid funding bans, parental notification and consent laws, bans on the use of public facilities for abortion, prohibitions on the participation of public employees in providing abortion services, bans on actual abortion procedures (e.g., "partial-birth" abortions), and prohibitions on the use of public funds to counsel women about or provide referrals for abortion services. In 1998, for example, 17 states were enforcing three or more abortion restrictions, a 467% increase from 1992. Over half the states enacted some restriction on access to abortion in 1997. An anti-abortion bill introduced into a state legislature in 1997 was more than twice as likely to be enacted than in 1996. Efforts to ban "partial-birth" or "late-term" abortions dominated legislative debate at both the federal and state levels in 1997. This resulted in 16 states banning this rare procedure and the U.S. Congress passing a bill to ban it. The bill was not signed by President Clinton, because it contained no provision to protect the mother's health or life.

[There is also diminishing access to abortion providers because of increased harassment and violence by anti-abortion groups and a shortage of physicians trained and willing to provide abortion services. Between 1982 and 1992, the number of abortion providers nationwide decreased by 18%. Many residency programs have eliminated abortion instruction from the curriculum altogether or have relegated it to an elective course. Currently, there are no abortion providers in 84% of the counties in the United States. The American Medical Association has concluded that the shortage of abortion providers has "the potential to threaten the safety of induced abortion" (AMA 1992).

[Private insurance companies, often with the blessing of state legislatures, are cutting back on coverage for contra-

ceptive services. Almost half—49%—of the typical large insurance plans exclude coverage for prescription contraception, although for women this often constitutes their major medication expenses. Illinois, North Dakota, and Texas have even enacted state legislation allowing health-care institutions or insurers to refuse to provide or counsel patients for healthcare services that violate their “organizational conscience,” including family planning, infertility services, vasectomy, female sterilization, and abortion procedures.

[These increasing obstacles to obtaining legal abortions demonstrate the successes of the anti-abortion groups, particularly in electing supporters into state and federal legislatures. It seems likely that the trend to erode access to abortion services will continue, at least in the short term. (*End of update by P. B. Koch*)]

#### *A Brief Legal History* PATRICIA BARTHALOW KOCH

As documented by Brodie (1994), early American common law accepted abortion up until “quickening” (movement of the fetus). Not until the early 1800s did individual states begin to outlaw abortion at any stage of pregnancy. By 1880, most abortions were illegal in the United States, except those “necessary to save the life of the woman.” However, since the right and practice of early abortion had already taken root in American society, abortionists openly continued to practice with public support and little legal enforcement. In the 1890s, doctors estimated that there were approximately two million abortions performed each year in the U.S. (Brodie 1994).

Before 1970, legal abortion was not available in the United States (Gordon 1976). In the 1950s, about one million illegal abortions were performed a year, with more than 1,000 women dying each year as a result. Three quarters of the women who died from abortions in 1969 were women of color. Middle- and upper-class women, often with difficulty and great expense, could get “therapeutic abortions” from private physicians. By 1966, four fifths of all abortions were estimated to be for married women, and the ratio of legal to illegal abortions was one to 110.

In 1970, New York State passed legislation that allowed abortion on demand through the 24th week if it was done in a medical facility by a physician. However, on January 22, 1973, the U.S. Supreme Court decided a landmark case on abortion—*Roe v. Wade*. The Court stated the “right of privacy . . . founded in the Fourteenth Amendment’s concept of personal liberty . . . is broad enough to encompass a woman’s decision whether or not to terminate her pregnancy” (Tribe 1992). The major points of this decision were:

1. An abortion decision and procedure must be left up to the pregnant woman and her physician during the first trimester of pregnancy.
2. In the second trimester, the state may choose to regulate the abortion procedure in order to promote its interest in the health of the pregnant woman.
3. Once viability occurs, the state may promote its interest in the potentiality of human life by regulating and even prohibiting abortion except when judged medically necessary for the preservation of the health or life of the pregnant woman.

Although induced abortion is the most commonly performed surgical procedure in the United States, various restrictions continue to be placed upon the accessibility of abortion for certain groups of women. For example, in 1976, the Hyde Amendment, implemented through the United States Congress, prohibited federal Medicaid funds from being used to pay for abortions for women with

low incomes. This is believed to contribute to the fact that low-income women of color are more likely to have second-trimester abortions, rather than first-trimester ones, since it takes time for them to save enough money for the procedure.

In addition, the Supreme Court has upheld various state laws that have been instituted to restrict abortions. In 1989, a Missouri law prohibiting the use of “public facilities” and “public employees” from being used to perform or assist abortions not necessary to save the life of the pregnant woman was upheld (*Webster v. Reproductive Health Services*). The court also upheld one of the strictest parental notification laws in the country in 1990 (*Hodgson v. Minnesota*). This law required notification of both of a minor’s parents before she could have an abortion, even if she had never lived with them. Along with this restriction came a “waiting period” provision. A court decision in *Rust v. Sullivan* (1991) upheld a “gag rule” that prohibited counselors and physicians in federally funded family-planning clinics from providing information and making referrals about abortion. In 1992, the court upheld many restrictions set forth in a Pennsylvania law (*Planned Parenthood v. Casey*). These restrictions included requiring physicians to provide women seeking abortions with pro-childbirth information, followed by a 24-hour “waiting period,” and parental notification for minors (Tribe 1992).

Nineteen years after the *Roe* decision, the *Casey* decision demonstrated that the Supreme Court was divided more sharply than ever over abortion. While a minority of justices wanted to overturn the *Roe* decision outright, the majority did not allow a complete ban of abortion. However, by enacting the “undue burden” standard, they did lower the standard by which abortion laws are to be judged unconstitutional. This standard places the burden of proof on those challenging an abortion restriction to establish that it is a “substantial obstacle” to their constitutional rights.

The various state laws now restricting abortion are particularly burdensome for younger and poorer women, and open the way for the creation of increasing obstacles to women’s access to abortion. Currently, only 13 states provide funding for poor women for abortions, and 35 states enforce parent-notification/consent laws for minors seeking abortions. At the same time, the Supreme Court has upheld the right to abortion in many cases.

The recent murders of physicians and staff at abortion clinics, arson and bombing of abortion clinics, and the blocking of abortion clinics by anti-abortion protesters have contributed to women’s difficulty in receiving this still-legal medical procedure. Over 80% of all abortion providers have been picketed, and many have experienced other forms of harassment, including bomb threats, blockades, invasions of facilities, property destruction, assault of staff and patients, and death threats.

In 1988, Operation Rescue, the term adopted by anti-abortion groups, brought thousands of protesters to Atlanta to blockade the abortion clinics. Using an 1871 statute enacted to protect African-Americans from the Ku Klux Klan, the federal courts invoked injunctions against the protesters. However, in 1993, this decision was overturned, leading to Operation Rescue blockades of abortion clinics in ten more U.S. cities. The federal government moved to apply the Racketeer Influenced and Corrupt Organization (RICO) Act against such blockades on the grounds that it was a form of extortion and part of a nationwide conspiracy. This application of the RICO Act was upheld unanimously by the Supreme Court in 1994. Despite this protection, there has nevertheless been a serious decline in the number of facilities and physicians willing to perform abortions.

### Current Abortion Practice

PATRICIA BARTHALOW KOCH

Legally induced abortion has become the most commonly performed surgical procedure in the United States. In 1988, 6 million pregnancies and 1.5 million legal abortions were reported. One in five women (21%) of women of reproductive age have had an abortion (Hatcher et al. 1994). If current abortion rates continue, nearly half of all American women will have at least one abortion during their lifetime.

Women having abortions in the United States come from every background and walk of life (Koch 1995). Abortion rates are highest among 18- to 19-year-old women, with almost 60% being less than 25 years old. One in eight (12%) are minors, aged 17 or younger. Of these minors, over 98% are unmarried and in school or college, with fewer than one tenth having had any previous children.

The vast majority (80%) of adult women having abortions are separated, divorced, or never married, with 20% currently married. One third of American women seeking abortions are poor. Almost half are currently mothers, with most of them already having two or more children. Half of the women seeking abortions were using a form of birth control during the month in which they conceived. About one third of abortion clients are employed, one third attend public school or college, and the other third are unemployed. The majority of women (69%) getting abortions are Anglo-American. Latinas are 60% more likely than Anglos to terminate an unintended pregnancy, but are less likely to do so than are African-American women.

Women with a more-liberal religious or humanist commitment are four times more likely to get an abortion than those adhering to conservative religious beliefs, according to Alan Guttmacher Institute surveys in 1991 and 1996. Catholic women are just as likely as other women to get abortions. Catholic women, who constitute 31% of the female population, had 31% of the abortions in 1996. In 1991, one sixth of abortion clients in the U.S. were born-again or evangelical Christians (Alan Guttmacher Institute 1991). In a similar 1996 survey, evangelical or born-again Christians, who account for almost half the American population, had 18% of the abortions.

Women give multiple reasons for their decision to have an abortion, the most important reasons being financial inability to support the child and inability to handle all the responsibilities of parenting. Three quarters of abortion clients believe that having a baby would interfere with work, school, or their other family responsibilities. Over half are concerned about being single parents and believe that the relationship with the father will be ending soon. Adolescent women, in particular, usually believe that they are not mature enough to have a child. One fifth of the women seeking an abortion are

concerned that either the fetus or they, themselves, have a serious health problem which necessitates an abortion. One in 100 abortion clients are rape or incest survivors. Most abortion clients (70%) want to have children in the future.

Half of the abortions in the U.S. are performed before the eighth week of gestation and five out of six are performed before the 13th week (Hatcher et al. 1994). The safest and easiest time for the procedure is within the first three months. Most (97%) women receiving abortions during this time have no complications or postabortion complaints. Vacuum curettage is the most widely used abortion procedure in the United States, accounting for 97% of abortions in 1989. Intra-amniotic infusion is the rarest form of abortion performed, accounting for only 1% of abortions in 1989.

The weight of research evidence indicates that legal abortion, particularly in the first trimester, does not create short or long-term physical or psychological risks for women, including impairment of future fertility (Russo & Zierk 1992). In 1985, the maternal death rate for legal abortions was 0.5 per 100,000 for suction methods, 4.0 for induced labor, and one in 10,000 for childbirth (Hatcher et al. 1994).

### Attitudes Toward Abortion

PATRICIA BARTHALOW KOCH

The National Opinion Research Center has been documenting attitudes toward abortion since 1972 (Smith 1996). Throughout this time period, public support for abortion under various circumstances has increased (see Table 19). The vast majority of Americans approve of abortion if a pregnancy seriously endangers the health of the mother, if the fetus has a serious defect, or if the pregnancy resulted from a rape or incest. Approximately half of the American public approves of abortion if the woman does not want to marry the father or if the parents cannot afford a child or do not want any more children. Close to half of Americans approve of abortion if the woman wants it for any reason. Level of education has the strongest effect on people's attitudes, with college-educated people being significantly more approving than those who are less educated. Catholics, fundamentalist Protestants, and Mormons who have a strong religious commitment are the most likely to disapprove of abortion. Anglo-Americans are somewhat more approving than African-Americans; men and adults under 30 are slightly more approving than women and adults over 65. In general, approval of legal abortion and the right of women to control their reproductive ability is associated with a broad commitment to basic civil liberties.

America is at a crossroads in terms of protecting the access of all women to abortion (Tribe 1992, 6). (See comments on efforts of the Christian Coalition to enact laws that restrict and limit access to abortion and abortion informa-

**Table 19**

#### Percentage of U.S.A. Adults Approving of Legal Abortion for Various Reasons (*Updated to 2000*)

Reason for Abortion	1972	1980	1990	1994	1996	1998	2000
Pregnancy poses serious health danger for woman	86.9%	90.1%	91.8%	90.6%	91.6%	87.9%	88.5%
Strong chance of serious defect of fetus	78.6	83.1	81.2	82.3	81.8	78.6	78.7
Pregnancy resulted from rape	79.1	83.4	84.8	83.6	84.3	80.1	80.6
Parent(s) low income—cannot afford a child	48.8	51.7	48.1	50.4	46.6	44.3	42.2
Unmarried woman who does not want to marry father	43.5	48.4	45.3	47.6	44.9	42.3	39.1
Married woman who does not want more children	39.7	47.1	45.1	48.3	46.7	42.3	40.7
Woman wants an abortion for any reason	NA*	41.1	43.4	46.3	45.0	40.9	39.9

\*NA = Not asked

Source: *General Social Surveys*. Chicago: National Opinion Research Center (NORC).

tion in Section 2A, Religious, Ethnic, and Gender Factors Affecting Sexuality, Sources and Character of Religious Values). The era of absolute judicial protection of legal abortion rights that began with the Supreme Court's 1973 decision in *Roe v. Wade* ended with that Court's 1989 decision upholding certain state regulations of abortion in the case of *Webster v. Reproductive Health Services*. Thus, a woman's right to decide whether to terminate a pregnancy was placed in the arena of rough-and-tumble politics, subject to regulation, and possibly even prohibition, by federal and state elected representatives. The range of abortion rights that many Americans have taken for granted are now in jeopardy. Even as the public agenda is stretched to address such new questions as the right to die, the use of aborted fetal tissue in treating disease, and the ethics and legal consequences of reproductive technologies, no issue threatens to divide Americans politically in quite as powerful a way as the abortion issue still does.

### [Abortion Update 2003

SUSAN DUDLEY

[Update 2003: Social conflict about abortion in the United States remains passionate on both sides, and is played out on several fronts: by both peaceful and violent demonstrators at public rallies and at abortion-clinic entrances, by politicians and their supporters in the state and federal legislatures, and by lawyers and advocates in the courts.

[The true motivation of anti-abortion activists who claim that their concern is protection of human life has been further questioned by correlational research that suggests that states with the most-restrictive laws and regulations on abortion tend to have fewer safeguards for maternal and infant health and safety than states where abortion laws are less restrictive (Schroedel 2000).

[When mainstream medical associations take a position on abortion, it is usually with the recognition that the provision of legal and medically safe abortion is a public health necessity that prevents the mortality and morbidity that invariably accompany illegal black-market abortion practices.

[Several of the more prominent advocacy organizations on both sides of the abortion debate have changed their names in recent years. The National Abortion Rights Action League (NARAL) became the National Abortion and Reproductive Rights Action League, and then more recently changed its name to NARAL Prochoice America. Operation Rescue also uses the name Operation Save America.

[The incidence of illegal and violent action taken by anti-abortion protestors has been high. Since 1977, the National Abortion Federation has documented at least 7 murders, 17 attempted murders, 353 death threats, 3 kidnappings, 41 bombings, 570 bomb threats, 166 arsons, 372 clinic invasions, 100 butyric acid attacks, receipt of 545 anthrax threat letters, 123 cases of assault and battery, 71 burglaries, 444 stalking incidents, and 686 clinic blockades.

[Enactment of the federal Freedom of Access to Clinic Entrances (FACE) Act in 1994 has helped to curb the incidence of illegal anti-abortion activities in recent years. This law forbids the use of "force, threat of force or physical obstruction" to prevent someone from providing or receiving reproductive health services. Nevertheless, 56% of clinics experienced anti-abortion harassment in 2000 (Henshaw & Finer 2001).

[The U.S. Supreme Court has issued several important rulings in response to challenges against laws passed to ban specific abortion procedures or to limit the availability of abortion in the U.S. For example, *Stenberg v. Carhart* in 2000 resulted in overturning abortion-procedure bans that had been enacted in a number of states. In the same year, *Hill v. Colorado* established that protestors coming closer

than eight feet from clinic patrons could be found guilty of harassment. In 2003, *Planned Parenthood v. American Coalition of Life Advocates* asserted that protestors are not free to make threats against the life and safety of abortion providers or their patients.

[In 2003, 17 states provide some funding for poor women for abortion, and 32 states enforce parent-notification/consent laws for minors seeking abortions (Alan Guttmacher Institute 2003).

[In 2000, 1.31 million abortions took place in the U.S., and it remains one of the most common procedures. Mifepri-stone was approved for induction of medical abortion in the U.S. in 2000, and approximately 6% of women who had abortions that year opted for this method instead of surgical abortions (Finer & Henshaw 2003).

[Each year, 2 out of every 100 women of reproductive age have an abortion, and 48% of them have had at least one previous abortion (Alan Guttmacher Institute 2003). At the current rate, it is estimated that 43% of American women will have an abortion in their lifetimes.

[Fifty-two percent of U.S. women who get abortions each year are younger than 25. Teenagers account for 19% of all abortions, and women 20 to 24 account for the other 33% (Alan Guttmacher Institute 2003).

[Fifty-four percent of women having abortions report that they used a contraceptive method during the month they became pregnant, and 8% report that they have never used a birth-control method (Alan Guttmacher Institute 2003).

[Unintended pregnancies are more than 3 times as likely to be terminated by abortion by black women and 2½ times as likely by Hispanic women as by white women in America (Alan Guttmacher Institute 2003).

[Also in 2003, application of RICO (organized racketeering) statutes in the prosecution of illegal anti-abortion activities was limited in a ruling on *Scheidler v. National Organization for Women*. (End of update by S. Dudley)]

[Update 2003: In early February 2003, President Bush announced a commitment of \$15 billion over the next five years to fight AIDS in the 15 African and Caribbean nations with the highest rates of AIDS infection. This allocation immediately raised the question of how distribution of the money could be managed without violating the so-called Mexico City policy barring American foreign aid to groups that consider abortion to be a valid family-planning option. One of the President's first acts in office in 2000 was to reinstate this ban, which was first imposed by President Ronald Reagan and later suspended by the Clinton administration.

[Faced with a clash between two goals—disseminating the AIDS money widely and holding to the anti-abortion position, the President adopted a compromise that would allow groups to receive the money to fight AIDS through the State Department's foreign assistance program as long as none of the money went to any family-planning activities that encourage or perform abortions.

[The policy would allow an organization that conducted family-planning activities that included abortion in one country to qualify for the AIDS money in another country. It would prohibit sending the money to an organization that ran integrated health clinics that included both AIDS treatment and abortion or abortion counseling, but would allow it if the AIDS treatment program and the family-planning activities were conducted and financed completely separately.

[Some groups that work on health and family-planning issues in poor countries said the administration's policy was likely to prove too restrictive by forcing them to choose between providing a full range of health services, including family planning, and taking the AIDS treatment money from the United States. (End of update by R. T. Francoeur)]

[Update 2003: The first indication of the social and medical impact of the legalization of mifepristone (RU-486) came in mid-January 2003 from an Alan Guttmacher Institute report. In a survey of American women ages 15 to 44 in the first six months of 2001, Finer and Henshaw reported that the U.S. abortion rate was continuing to decline and had reached its lowest point since the 1970s, 21.3 abortions per 1,000 women ages 15 to 44. The number of providers also declined in the first half of 2001. However, physicians used mifepristone to perform more than 37,000 nonsurgical abortions, about 6% of all abortions induced in the first six months after the controversial drug became available to American women. (End of update by R. T. Francoeur)]

## **[E. Other Reproductive and Sexual Health Issues**

### *[Infertility and Assisted Pregnancy*

ROBERT T. FRANCOEUR

[Update 1998: America's romance with assisted reproductive technology began a hundred years ago when J. Marion Sims made 55 attempts at "ethereal copulation," as artificial insemination with donor semen (AID) was then known. His success rate at Jefferson Medical School in Philadelphia was only 4%, because insemination was performed just before or after menstruation, which was wrongly believed at the time to be a woman's most fertile period. In 1960, Bunge and Sherman experimented with artificial insemination using frozen donor semen at the State University of Iowa, whereas Behrman and associates at the University of Michigan reported 29 successful pregnancies using frozen semen. By 1974, America had 28 private and public sperm banks, with approximately 20,000 pregnancies a year from artificial insemination, double the mid-1960s' rate (Francoeur 1977).

[In 1981, reproductive specialists at Eastern Virginia Medical Center produced American's first *in-vitro* fertilized (IVF) baby, three years after the world's first IVF baby in Cambridge, England. Some American feminists organized a Feminist International Network on the Reproductive Technologies to protest "female slavery and exploitation by male infertility specialists and patriarchal husbands" (Ardetti, Klein, & Minder 1984).

[Other forms of assisted reproductive technology have followed, including embryo transplants, surrogate motherhood, embryo lavage for harvesting ova from donors, epididymal aspiration of sperm, and microinsemination of ova with single sperm. Social complications quickly followed. The court fight of Mary Beth Whitehead, a New Jersey surrogate mother, to retain custody of "Baby M," whom she had contracted to carry for an infertile couple, made national news. In the aftermath, several states outlawed surrogate-mother contracts and prohibited payment. In 1990, when a divorcing couple fought over custody of seven frozen embryos remaining from fertility treatments, the court declared the frozen embryos "human life from the moment of conception," and awarded custody to the mother (Holmes, Hoskins, & Gross 1981; Corea 1985). The 1990s have witnessed a flood of new technologies, including insertion of sperm and zygotes into the fallopian tube (GIFT and ZIFT), postmenopausal pregnancies, and frozen eggs.

[Three major psychological, social, and ethical controversies have emerged from these technologies. The first involves "designer and discount designer embryos." Several American infertility clinics now offer infertile couples the option of paying \$20,000 or more to select donor sperm and egg from a select list of designer donors. After IVF, several designer zygotes are implanted in the adoptive woman's uterus. If any embryos are left in cryogenic storage after a

successful pregnancy, they may be sold at a discount to other infertile couples.

[The high risk of multiple births is a second issue. England, Australia, and most European countries have laws prohibiting transfer of more than two or three embryos in each pregnancy attempt. These clinics have a success rate about 20% lower than American clinics, which are not subject to any limit on the number of embryos they transfer. American clinics typically transfer four or five embryos per attempt, but some clinics transfer as many as ten. The result is a high risk of multiple pregnancies that are themselves dangerous to both mother and offspring. In a survey of 281 American infertility clinics in 1995, 37% of all births were multiple births, contrasted with 2% in the general population. Woman under age 35 experienced a 17% pregnancy rate and a 3% multiple-pregnancy risk when two embryos were transferred. Transfer of four embryos gave a 34% pregnancy rate, but a multiple-pregnancy risk of 15%. Transferring more than four embryos does not improve the fertility rate, but it does increase the multiple births. In 1997, infertility treatment resulted in the survival of the McCaughey septuplets, the world's second set of surviving septuplets, the first being in Saudi Arabia.

[Some clinics transfer multiple embryos in the hope of raising their fertility rate, in order to attract more clients. A clinic that reduces the risk of multiple pregnancy faces a lower fertility rate and may not survive in the competition for clients. The present practice is not pleasant for infertile couples who have to decide whether to let a multiple pregnancy go to full term and risk losing all or some of the offspring, or to resort to "selective reduction," which aborts several of the multiple embryos early in pregnancy. Selective reduction improves the survival of the one or two remaining embryos, but it may also trigger a miscarriage of all the embryos.

[Finally, there is the issue of payment for donor eggs. When egg donation was first introduced, donors were paid a few hundred dollars. More recently, the standard fee has been \$2,500. In early 1998, a major New Jersey hospital offered donors \$5,000, because their clients were being forced to wait up to a year for an egg. The shortage of donor eggs has brought private egg brokers into the market, with some brokers offering \$35,000 for a suitable donor. (End of update by R. T. Francoeur)]

## *10. Sexually Transmitted Diseases and HIV/AIDS*

### **A. Sexually Transmitted Diseases**

ROBERT T. FRANCOEUR

It is impossible to obtain reliable statistics about the incidence of STDs, because American physicians are only required by law to report cases of HIV and syphilis to the Centers for Disease Control and Prevention (CDC). Public clinics keep fairly reliable statistics, but many private physicians record syphilis and other STDs as urinary infections and do not report them to the CDC. A second, equally important factor leading to the lack of data is the number of persons infected with various STDs who are without symptoms and do not know they are infectious. This "silent epidemic" includes most males infected with candidiasis, 10% of males and 60 to 80% of females infected with chlamydia, 5 to 20% of males and up to 80% of females with gonorrhea, and many males and females with hemophilus, NGU, and trichomonas infections.

In 1995, the nation's three most commonly reported infections were sexually transmitted, according to statistics from the federal Centers for Disease Control and Preven-

tion released in October 1996. Chlamydia, tracked for the first time in 1995, topped the list with 477,638 cases. Gonorrhea, the most commonly reported infectious disease in 1994 with 418,068 cases dropped to second in 1995 with 392,848 cases. AIDS dropped from second place in 1994 (78,279 cases) to third place in 1995 (71,547 cases). In 1995, five sexually transmitted diseases, chlamydia, gonorrhea, AIDS, syphilis, and hepatitis B, accounted for 87% of the total number of infectious cases caused by the top ten maladies. Chlamydia was more commonly reported among women, striking 383,956 in 1995; gonorrhea and AIDS were more common with men, with 203,563 and 58,007 cases, respectively.

The latest data suggest that the national incidence of gonorrhea and syphilis has continued to decline (U.S. Department of Health and Human Services 1994). Reported cases of gonorrhea peaked at a million cases in 1978 and declined to about 700,000 cases in 1990. With a realistic estimate suggesting two million new cases annually, gonorrhea is one of the most commonly encountered STDs, especially among the young. About 50,000 new cases of syphilis are reported annually; an estimated 125,000 new cases occur annually. Syphilis is primarily an adult disease, mostly concentrated in larger cities, and one of the least common STDs. The incidence of syphilis rose sharply between the late 1980s and the early 1990s, and then continued its more long-term decline. Congenital syphilis rates have decreased in parallel to declining rates of syphilis among women. Infants most at risk were born to unmarried, African-American women who receive little or no prenatal care. Syphilis and gonorrhea have consistently been more common in the southern states. Reasons for this are not well understood, but may include differences in racial and ethnic distribution of the population, poverty, and the availability and quality of healthcare services.

Chlamydia is the most prevalent bacterial STD in the United States, with four million adults and possibly 10% of all college students infected. It is more common in higher socioeconomic groups and among university students. Prevention and control programs were begun in 1994, and are a high priority because of the potential impact on pelvic inflammatory disease (PID) and its sequelae, infertility and ectopic pregnancy. Twenty to 40% of women infected with chlamydia develop PID. Many states have implemented reporting procedures and begun collecting case data for chlamydia.

Three million new cases of trichomonas are reported annually, but probably another six million harbor the protozoan without symptoms. Fifteen million Americans have had at least one bout of genital herpes. About a million new cases of genital warts are reported annually.

STD rates continue to be much higher for African-Americans and other minorities than for white Americans, sixtyfold higher for blacks and fivefold higher for Latinos. About 81% of the total reported cases of gonorrhea occur among African-Americans, with the risk for 15- to 19-year-old blacks more than twentyfold higher than for white adolescents. Similarly, the general gonorrhea rate is fortyfold higher for blacks and threefold higher for Latinos than it is for white Americans. There are no known biologic reasons to explain these differences. Rather, race and ethnicity in the United States are risk markers that correlate with poverty, access to quality healthcare, healthcare-seeking behavior, illicit drug use, and living in communities with a high prevalence of STDs.

[*Recent Developments* PATRICIA BARTHALOW KOCH  
[Update 1998: In 1997, a Committee on Prevention and Control of Sexually Transmitted Diseases issued an im-

portant analysis of the epidemiology of STDs (except for HIV) and effectiveness of public health strategies to prevent and control them in the United States (Eng & Butler 1997).

[The Committee, sponsored by the Institute of Medicine, an adviser to the federal government, concluded that STDs are hidden epidemics of enormous health and economic consequence in the United States. The incidence rates of curable STDs in the United States are the highest in the developed world, with rates that are 50 to 100 times higher than other industrialized nations. For example, the reported incidence of gonorrhea in 1995 was 150 cases per 100,000 persons in the United States versus three cases per 100,000 in Sweden. STDs continue to have a disproportionate impact on women, infants, young people, and racial/ethnic minorities. The estimated overall costs from STDs in the United States was nearly \$17 billion in 1994.

[Updates concerning the epidemiology and consequences of STDs in the United States are provided by the Centers for Disease Control and Prevention (CDC 1998). Chlamydia (an estimated 4,000,000 new cases each year) and gonorrhea (800,000 new cases each year) are a major cause of pelvic inflammatory disease (PID). Among American women with PID, 20% will become infertile, and 9% will have an ectopic pregnancy, which is the leading cause of first-trimester pregnancy-related deaths in American women. The ectopic pregnancy rate could be reduced by as much as 50% with early detection and treatment of STDs. In addition, fetal or neonatal death occurs in up to 40% of pregnant women who have untreated syphilis. There are an estimated 101,000 new cases of syphilis each year, with 3,400 infants born with congenital syphilis.

[Genital herpes may now be the most common STD in the United States, with perhaps more than 45 million Americans, including 18% of whites and 46% of blacks, carrying the herpes virus. Despite an emphasis on safe sex to prevent HIV/AIDS, the Centers for Disease Control reported that genital herpes had increased fivefold since the late 1970s among white teenagers and doubled among whites in their 20s. In all, about one in five Americans is infected with genital herpes. There are an estimated 200,000 to 500,000 new symptomatic cases each year. In addition, it is likely that more than 24 million Americans are infected with human papilloma virus (HPV), with an estimated 500,000 to a million new infections each year. Sexually transmitted HPV is the most important risk factor for cervical cancer, which was responsible for about 5,000 deaths in 1995.

[To deal with this silent epidemic in the United States, the Institute of Medicine Committee made a strong advocacy statement in support of establishing an effective national system for STD prevention. To accomplish this, four major strategies were recommended for implementation by public- and private-sector policymakers at the local, state, and national levels:

1. Overcome barriers to adoption of healthy sexual behaviors, particularly through a nationally organized mass-media campaign;
2. Develop strong leadership, strengthen investment, and improve information systems for STD prevention;
3. Design and implement essential STD-related services in innovative ways for adolescents and underserved populations; and
4. Ensure access to and quality of essential clinical services for STDs.

[The report concluded that the veil of enforced secrecy about sexual health must be lifted, public awareness raised, and bold national leadership must come from the highest

levels in order to overcome the public health shame of STD epidemics. However, it is unlikely that these recommendations will be put into action, and Americans will needlessly continue to suffer the physical, emotional, social, and financial consequences of these preventable diseases. (End of update by P. B. Koch)]

[Update 2002: For the first time in over a decade, the Centers for Disease Control reported an increase in cases of syphilis, largely because of outbreaks among gay and bisexual men in several U.S. cities. After dropping every year since 1990, the syphilis rate increased from 2.1 cases per 100,000 people in 2000 to 2.2 cases per 100,000 in 2001. Syphilis among women actually dropped 17.6% in 2001. More than two thirds of the new syphilis patients were men. Between 1997 and 2001, syphilis outbreaks erupted in New York City, Seattle, Chicago, San Francisco, and Miami, with a major contribution from men having sex with men (Yee 2002). (End of update by R. T. Francoeur)]

[Status as of 2003

KAREN ALLYN GORDON

[Update 2003: While obtaining accurate and current data on sexually transmitted diseases (STD) and sexually transmitted infections (STI) in the United States is difficult, the availability of public health data has greatly improved over the last decade because of changes in case identification, expanded reporting, surveillance systems, and epidemiological investigations. For some diseases, such as chlamydia, increased cases may be attributed to increased screening efforts and better identification through use of more-sensitive screening tests. Underestimating and reporting of STDs may also be influenced by reluctance to seek treatment in a public clinic, lack of reporting from private practitioners, access to quality services, fear of discrimination, cost, stigma, and stresses of daily life. Much remains to be investigated beyond clinical concerns in terms of the social level of infection and disease patterns in geographic regions and population subgroups as identified by age, race, ethnicity, socioeconomic level, and sexual-practice patterns.

[More is known about the trends of some STDs because of long-term surveillance. Over a 40-year period, 1950 to 2000, data are available on syphilis, gonorrhea, and chancroid through reporting by state health departments. Hepatitis B was added as of 1970 and chlamydia as of 1990. As of 2000, all 50 states and the District of Columbia require reporting of chlamydia cases to the Centers for Disease Control and Prevention (CDC).

[For nationally notifiable diseases for 2002, virus-based conditions include human immunodeficiency virus (HIV infection), acquired immunodeficiency syndrome (AIDS), and hepatitis B, while bacterial conditions include gonorrhea, chlamydia, and syphilis.

[In all, about 25 diseases or infections occur from or are associated with sexual intercourse, for which only estimated data on incidence and prevalence are available on herpes, human papilloma virus (HPV), trichomoniasis, and bacterial vaginosis. The rates for notifiable STDs for 2000 exceed the national health objectives proposed in *Healthy People 2010*.

[Among the most common STDs in the United States, trends show a decline in cases of gonorrhea from 445.10 per 100,00 in 1980 to 128.3 per 100,00 in 2001, as well as syphilis from 20.34 of primary and secondary cases per 100,00 in 1990 to 2.1 cases of primary and secondary cases in 2001. Outbreaks in certain geographic areas and among men who have sex with men, for example, reflect the persistence of the disease and difficulty in eradication (Fox et al. 2001). During 2001, a 2% increase (2.17 cases per 100,000) re-

flected a 15.4% increase among men, but a 17.7% decrease among women, across all ethnic and racial groups. Rates are disproportionately high in certain cities or geographic regions such as the South. Chancroid reflected a decline from 0.3 cases per 100,000 in 1980 to 0.01 cases per 100,000 in 2001.

[By comparison, *Chlamydia trachomatis* (a notifiable disease in 1995) increased from 190.42 cases per 100,000 in 1990 to 278.3 cases per 100,000 in 2001. Regional data suggest that declines in prevalence of chlamydia may be related to increased use of screening programs through family planning clinics.

[In 2000, rates of chlamydia and gonorrhea were higher for female 15- to 19-year-olds and in male 20- to 24-year-olds. In 2001, the rate for females was 435.19 cases per 100,000. Disproportionately higher rates of chlamydia occurred among blacks and American Indian and Alaskan Natives, showing a similar pattern for gonorrhea and syphilis, both primary and secondary.

[Estimates of human papilloma virus prevalence suggest that up to 20 million people are infected, with the prevalence of HPV-16 being at least twice as high among women as among men. Based on data from the *National Health and Examination Survey (NHANES)* of 1999, estimated prevalence of herpes in the general U.S. population ages 14 to 49 was 19%, suggesting an increase in prevalence among teens over the last two decades.

[Consequences of STDs place women at risk for more-serious medical complications. Pelvic inflammatory disease (PID) is a serious consequence associated with gonorrhea and chlamydia, which can lead to infertility, chronic pelvic pain, and ectopic pregnancy. The consequences of reactivation or reinfection of certain types of HPV, with its increased risk for dysplasia and cervical cancer in women, make this an especially serious STD. Herpes, hepatitis B, and HIV infection can be passed from an infected woman to a fetus or infant.

[In the United States, state and federally funded programs for reporting, control, and prevention underscore the need for heightened awareness of the magnitude of epidemics associated with sexual activity. Despite the decline of STDs such as syphilis, the patterns of increase of HIV in selected subpopulations and viral STDs, such as genital herpes and HPV across all socioeconomic levels and among teens, call for new behavioral surveillance and relevant interventions related to sexual practices and relationships (Cates et al. 1999; CDC 2000, 2001, 2002, 2003; Gross 2003; National Center for Health Statistics 2002). (End of update by K. A. Gordon)]

[*Human Papilloma Virus and Cervical Cancer*

PEGGY CLARKE

[Update 2003: Worldwide, cervical cancer is the second most common cancer in women. In the United States, cervical cancer accounts for over 12,000 new cases and over 4,400 deaths each year. Detected early, this cancer is preventable in virtually all cases. In recent years, the direct link between cervical cancer and human papilloma virus (HPV), which is a sexually acquired infection, has been confirmed.

[There are over 70 different strains of HPV, only a small number of which are linked to cervical cancer. Other strains, of significantly lower health risk and non-cancer causing, can appear as visible genital warts. As many as 20 million Americans may be infected with one or several strains of HPV, some of which pass out of the body undetected. Most HPV infections are transient and the majority of those infected are unaware of the infection and shed the virus with no ill effects. In most cases, the HPV virus is harmless and

carries no symptoms; however, an HPV infection that causes changes in the cervical cells can, if left untreated, lead to cervical cancer.

[While anyone who has ever been sexually active may have acquired an HPV infection, only rare cases will lead to cervical cancer. However, cervical cancer is fully preventable, if early pre-cancerous cells can be detected and treated early. The PAP test detects changes in the cervix, showing that a person may be at risk for cervical cancer. This test involves collecting a small sample of cells from the cervix, with subsequent examination under a microscope for the presence of abnormal cells.

[In addition to the PAP test, there now exists a test to detect the presence of specific cancer-related types of HPV. This test is performed by collecting cells from the cervix and is then sent to a lab for evaluation. Testing for HPV infection, in combination with a PAP test, has been approved for routine screening of women who are 30 years and older. (The combination test is called DNA with PAP test.) A negative test result means the patient has little or no risk of having cervical cancer, providing added confidence in the screening for infection. A positive test result indicates the presence of cancer-related HPV. A positive HPV test result with a normal PAP result does not mean the patient has or will develop cervical cancer; however, following screening guidelines, the positive result indicates the need for close medical monitoring. (*End of update by P. Clarke*)

## B. HIV/AIDS

### *A National Perspective, 1997* ANDREW D. FORSYTH

In a single decade, human immunodeficiency virus (HIV), the agent that causes acquired immunodeficiency syndrome (AIDS), has become one of the greatest threats to public health in the United States. By 1992, AIDS surpassed heart disease, cancer, suicide, and homicide to become the leading cause of death among men between ages 25 and 54 (CDC 1993a). Similarly, AIDS became the fourth leading cause of death among women between ages 25 to 44 in 1992 and the eighth leading cause of death among all United States citizens. Over one million people are estimated to be infected with HIV in the United States—approximately 1 in 250—and over 441,528 cases of AIDS have been diagnosed, 62% of which have already resulted in death (CDC 1994a).

Trends suggest that AIDS will continue to have a significant impact in the United States in coming years. Throughout the 1980s and early 1990s, there was a steady increase in the number of documented AIDS cases. However, between 1993 and 1994, the number of AIDS cases reported to public health departments nationwide dramatically increased because of the implementation of an expanded surveillance definition of AIDS, which included cases of severe immunosuppression manifesting in earlier stages of HIV infection. Although the number of AIDS cases declined in 1994 relative to the previous year, it still represents a considerable increase over cases reported in 1992 (CDC 1995a).

Consistent with previous years, the most severely affected segment of the U.S. population in 1994 was men who have sex with men. Although men constitute 82% of all AIDS cases reported among adults and adolescents (13 years or older), men who have sex with men represent the single largest at-risk group, constituting 44% of all nonpediatric AIDS cases (CDC 1994a). Young men who have sex with men (between ages 20 and 24) constitute a particularly salient at-risk group for HIV infection, representing 60% of AIDS cases among all men of that same age. In contrast, 53% of all men with AIDS occur in men who have sex with men.

Even so, the number of AIDS cases reported among men who have sex with men decreased by 1.1% for the second

consecutive year in 1992, suggesting that infection rates among this segment of the population may be leveling off (CDC 1993a). The same cannot be said for heterosexual men who inject drugs and men who inject drugs and have sex with men; they represent the second and third largest at-risk groups among men, explaining 24% and 6% of AIDS cases, respectively (CDC 1994b). Newly reported AIDS cases for these groups continue to increase sharply. Although only 4% of all men diagnosed with AIDS by 1994 were infected via sexual contact with an infected woman, they had the largest proportionate increase in AIDS cases among all men in recent years (CDC 1994a).

The proportion of AIDS cases reported among women has more than doubled since the mid-1980s (CDC 1994b). In 1994, 58,448 cumulative cases of AIDS were documented among women, comprising 13% of all adults and adolescents (13 years or older) diagnosed with AIDS in the United States (CDC 1994a). Although they represent a minority of all AIDS cases, the incidence of AIDS among women has increased more rapidly than have rates for men, with over 24% of all cases of AIDS among women reported in the last year alone (CDC 1994b). The impact of the CDC's implementation of the expanded case definition for AIDS is particularly salient for incidence rates among women: In 1994, 59% of cases of women with AIDS were reported based on the revised surveillance definitions. Correspondingly, the incidence of AIDS opportunistic illness (AIDS-OI) has increased more rapidly among women than it has for men. Overall, the modes of HIV transmission for women also differ considerably from those for men: Women are most likely to be infected via intravenous drug use (41%) or sex with infected men (38%). Although 19% of women with AIDS reported no risk of exposure to HIV, follow-up data from local public health departments suggested an inverse trend. Most of those with previously unidentified risk exposure were infected via heterosexual contact (66%) or intravenous drug use (27%) (CDC 1994b).

Because women of childbearing age (i.e., 15 to 44 years old) represent 84% of AIDS cases among women, perinatal transmission of HIV presents itself as a serious problem (CDC 1994b). In comparison with the statistics for HIV transmission for all women cited above, the most frequently reported modes of HIV transmission for seropositive new mothers were by heterosexual contact with infected male partners (36%) and injection drug use (30%) (CDC 1994a). However, it is often impossible to separate these two avenues of infection, because women may be having sex with an infected male while also using IV drugs, both before and during pregnancy. According to recent trends, approximately 7,000 HIV-infected women gave birth to infants in the United States in 1993; about 30% of these infants may have contracted HIV perinatally (Gwinn et al. 1991). In 1994, 1,017 cases of AIDS were documented among children less than 13 years of age, an increase of 8% from 1993. In 92% of these cases, children contracted HIV perinatally (CDC 1994a). Demographically, there were no apparent differences in perinatal transmission rates between boys and girls; however, most newly reported cases of pediatric AIDS occurred among African-American (62%) and Hispanic (23%) children (CDC 1995a). By December 1994, a cumulative total of 6,209 AIDS cases were documented among children 13 years or younger (CDC 1994a).

In any discussion of incidence, etiology, and the avenues of infection for HIV/AIDS, the official CDC statistics are quite misleading, especially when comparing figures for different years. The clinical definition of the AIDS syndrome has been expanded several times, making the incidence seem comparatively lower in earlier years. In addi-

tion, the CDC has not been consistent in studying modes of infection, especially for women. The intake interview questions asked of men and women seeking HIV testing have changed significantly over the years; they also differ significantly for men and women, with several possible avenues of infection left out in the questions for women. In the 1980s, being born in a developing country could be listed as an avenue for men and women testing HIV-positive; women, but not men, were asked if they had had sex with a person from a developing nation. Also, the criteria for assignment to the "unidentified risk" category has changed back and forth, which in turn raises or lowers the number of infected individuals in other categories.

Clearly, adolescents and young adults are at-risk for HIV infection as well, although modes of transmission for them vary considerably. In 1994, there was a cumulative total of 1,965 cases of AIDS among adolescents between ages 13 and 19 years (CDC 1994a). For this age group, males represented 66% of AIDS cases and most frequently contracted HIV through receipt of infected blood products (44%), through sex with men (32%), or through injection drug use (7%). In contrast, females between the ages of 13 and 19 most frequently contracted HIV through sexual contact with infected men (52%) or injection drug use (18%); 22% of these young women failed to identify an exposure category. For young adults between the ages of 20 and 24, men represented 77% of AIDS cases, most of whom contracted HIV through sex with men (63%), injection drug use (13%), or sex with men and injection drug use (11%). Young women in this group were most likely to be infected with HIV through sexual contact with infected men (50%) or injection drug use (33%). Another 14% of women in this age group failed to identify an exposure category, although it is possible that the most frequent mode of transmission for them and their younger peers parallels that of older women who initially failed to report an exposure category, most of whom were infected via sexual contact with infected men (CDC 1994a).

The impact of the AIDS epidemic has been especially devastating in communities of color in the United States, largely because of a number of socioeconomic factors that disproportionately affect racial and ethnic minorities (CDC 1993b). Although they represent only 21% of the population, racial and ethnic minorities presently constitute 47% of cumulative AIDS cases among adult and adolescent men, 76% of cases among adult and adolescent women, and 81% of all pediatric AIDS cases (CDC 1994a). In 1994, African-Americans and Hispanics alone represented 58% of the 80,691 reported AIDS cases for that year, and they had the highest rates of infection per 100,000 people (100.8 and 51.0, respectively). In contrast, Asian/Pacific Islanders and American Indians/Alaska Natives comprised 577 (0.007%) and 227 (0.003%) of AIDS cases, respectively, reported in 1994 and had the lowest rates of infection per 100,000 people (6.4 and 12.0%, respectively). Whites comprised 33,193 (41%) of AIDS cases reported in 1994 and had the third highest infection rate per 100,000 people (17.2%).

The disproportionate effects of AIDS on racial minorities in the U.S. are most salient among women and children. In 1994, infection rates among African-American and Hispanic adult and adolescent women (i.e., 13 years and older) were 16.5 and 6.8 times higher than were rates for white women of the same ages, respectively (CDC 1994a). Likewise, infection rates among African-American and Hispanic children (i.e., less than 13 years old) were 21 and 7.5 times higher than were rates for white children, respectively. Although racial and ethnic status do not themselves confer risk for HIV/AIDS, a number of sociocultural factors

inherent to many communities of color increase the risk of HIV infection, including chronic underemployment, poverty, lack of access to health-education services, and inadequate healthcare (CDC 1993b).

Clearly, AIDS has quickly emerged as a leading threat to public health facing United States citizens. Although there appear to be trends indicating that the impact of AIDS is leveling off in some risk groups (e.g., men who have sex with men), it is increasing steadily in others (e.g., African-American and Hispanic women and children). Furthermore, it is possible that additional segments of the population are currently "at risk" for HIV infection, including the severely mentally ill, older adults, and women who have sex with women. AIDS cases among them may constitute a third wave in the AIDS epidemic.

Because there is no cure for AIDS, behavioral change that reduces risk of exposure to HIV (e.g., unprotected sex and sharing of needles while injecting drugs) is paramount. Interventions focusing on AIDS education, self-protective behavioral change, and utilization of existing medical and testing services together represent the most promising course of action in the prevention of HIV infection and AIDS in the United States.

The clinical definition of AIDS has been revised twice by the Centers for Disease Control, first in 1987 and then in 1993, when new female symptoms for invasive cervical (stage 4) and other disease were added, along with a revision in the T4 (helper) cell count. These redefinitions need to be considered when interpreting statistics on the rates of AIDS infection.

Confidential testing for HIV status is available nationwide, with a free or sliding-scale fee and counselors available to assist in informing partners of HIV-positive persons. Several states have won the right to test all prospective employees for HIV and share this information with related agencies. The American Civil Liberties Union has won a court decision denying mandatory testing. Legal and ethical challenges posed by HIV/AIDS are far-reaching, and it may be another decade before consistent, reasonable, and effective guidelines emerge.

Although African-Americans constitute 12% of the population, they represent 27% of the reported AIDS cases (CDC 1992), these infections being more because of heterosexual intercourse and IV-drug use than to gay and bisexual men. Hispanics are also overrepresented, with 16% of reported cases. Consequently, there is an urgent need for development of the education and prevention programs in the African-American and Latino communities.

College students pose a particular problem. Changes in college-student behaviors between 1982 and 1988 were not encouraging. In a comparison of student behavior among 363 unmarried students in 1982 (when the term AIDS was coined and few articles were published on the subject) and 273 students in 1988, the number of students having intercourse, the number of partners, and the lifetime incidence of intercourse all increased. In 1988, 72% of men and 83% of women had received oral sex, and 69% of males and 76% of females had given oral sex; 14 and 17%, respectively, had engaged in anal sex. Twenty percent of males and 12% of females in 1988 had four or more partners. Students with multiple or casual partners were less likely to use condoms; there also was no increase in condom use from the first to the most recent intercourse (Bishop & Lipsitz 1991).

Despite the need and proven effectiveness of sterile needle-exchange programs for IV-drug users and the free distribution of condoms in high schools, both programs have met considerable opposition from conservative groups and the religious right. At the same time, the need for safer-

sex education for all segments of the population has allowed educators to make considerable progress in general sexuality education that might not have been possible if AIDS did not pose such a major public health problem.

### [Emerging Trends Prior to 2000]

PATRICIA BARTHALOW KOCH

[Update 1998: A major development in the course of the AIDS epidemic in the United States was heralded in 1996. For the first time, there was a marked decrease in deaths among people with AIDS (PWAs)—12% less during the first two quarters of 1996 as compared to 1995 (CDC 1996). This decline in deaths is likely because of two factors:

1. The slowing of the epidemic overall, in part because of the effectiveness of prevention efforts, with an increase in people diagnosed with AIDS of only 2% in 1995; and
2. Improved treatments, including the use of protease inhibitors, which lengthen the lifespan of PWAs.

[Yet, it must be noted that AIDS deaths are not declining among all groups. For example, deaths declined among men by 15% but increased among women by 3%. Deaths declined among men who have sex with men by 18%, among injecting-drug users by 6%, but increased among people contracting AIDS through heterosexual contact by 3%. The death rate is also not decreasing equally among various racial/ethnic groups. Declines were greater among whites (21%) than among Hispanics (10%) or blacks (2%).

[The cumulative number of AIDS cases reported to the CDC through June 30, 1997, was 612,078. Adult and adolescent cases totaled 604,176, with 511,934 (85%) cases in males and 92,242 (15%) cases in females. An additional 7,902 cases were reported in children under age 13. Racial/ethnic minorities continued to be disproportionately affected by AIDS, as illustrated by the breakdown of AIDS cases by race/ethnicity: white, not Hispanic—279,072 (46%); black, not Hispanic—216,980 (36%); Hispanic—109,252 (18%); Asian/Pacific Islander—4,370 (7%); American Indian/Alaskan Native—1,677 (3%).

[With the increasing number of people living with HIV and AIDS, additional resources will be needed for services, treatment, and care. A major breakthrough in the treatment of HIV disease has been the use of “drug cocktail” therapy, which combines the use of multiple drugs, usually a protease inhibitor with one or two reverse transcriptase inhibitors. Research has shown that this combination-drug therapy can dramatically prolong survival and slow disease progression in people with advanced AIDS, as well as holding the virus for many months below minimum detectable blood levels (Smart 1996). In fact, AIDS deaths in the United States declined 44% between 1996 and 1997. As of mid-1998, the long-term effectiveness of these treatments is unknown, with concern over the development of resistance leading to more virulent strains of HIV. Also, the expense of these drugs (approximately \$20,000 or more per year) prohibits large segments of HIV-infected people, often from minority groups, from receiving treatment. Prevention efforts must still be emphasized, since they remain the best and most cost-effective strategies for containing HIV and saving lives. (End of update by P. B. Koch)]

[Update 2002: UNAIDS Epidemiological Assessment: The current status of the epidemic and recent trends in the U.S. include the following:

- Women account for an increasing proportion of people with HIV and AIDS, but men still account for the largest proportion.

- Racial/ethnic disparities among people with HIV and AIDS continue to increase. Among men with AIDS recently diagnosed, 62% were non-Hispanic black or Hispanic; among women, 81% were non-Hispanic black or Hispanic.
- The impact of HIV among adolescents and young adults (ages 13 to 24 years) is not apparent from AIDS case surveillance data alone. In 25 states with HIV reporting, adolescents and young adults accounted for 13% of recent HIV diagnoses compared with 3% of AIDS diagnoses. HIV surveillance data suggest steady HIV transmission among people in this age group.
- HIV surveillance data indicate an epidemic with higher proportions of women, blacks, and heterosexually acquired infections than indicated by AIDS case data alone.
- Male-to-male sexual contact, still the predominant mode of HIV exposure, accounted for 41% of all recent AIDS diagnoses, and 54% of cases recently diagnosed among men.
- The proportion of AIDS cases attributed to heterosexual contact has continued to increase, and accounted for 22% of recently diagnosed cases (11% of cases among men, and 59% of cases among women).
- Injection drug use accounted for 30% of all recently diagnosed AIDS cases (27% of cases among men, and 38% of cases among women).
- Perinatally acquired AIDS has declined significantly, primarily because of the use of zidovudine to prevent HIV transmission.
- Regional trends: In all regions of the United States, most AIDS cases, cumulative and recent, have been diagnosed among persons from larger metropolitan areas. In each region, rates (cases reported per 100,000 population) were highest in the large metropolitan areas, intermediate in smaller metropolitan areas, and lowest in rural areas. Large metropolitan-area rates were highest in the Northeast; smaller metropolitan-area rates were highest in the Northeast and South; and rural-area rates were highest in the South.

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	890,000	(rate: 0.6%)
Women ages 15-49:	180,000	
Children ages 0-15:	10,000	

[An estimated 15,000 adults and children died of AIDS during 2001.

[No estimate is available for the number of American children who had lost one or both parents to AIDS and were under age 15 at the end of 2001. (End of update by the Editors)]

### [A 2003 HIV/AIDS Update ROBERT T. FRANCOEUR

[Update 2003: In 2002, for the first time in a decade, the number of newly diagnosed cases of AIDS rose in the United States, a disturbing turnaround that health officials warn reflects growing complacency about the dangers of HIV.

[For gays and bisexual men, HIV diagnoses rose for the third straight year. HIV diagnoses among gay and bisexual men rose 7.1% in 2002 in 25 states with long-standing HIV reporting procedures, according to the Centers for Disease Control and Prevention. The number represented an increase of nearly 18% since 1999, disturbing because the number of newly diagnosed HIV cases per year fell steadily throughout the 1990s, even among gay men. For the country as a whole, the CDC reported 42,136 AIDS diagnoses in 2002, a 2.2% increase from the previous year, and the first rise since 1993.

[The increase in HIV cases can be blamed on a younger generation that does not remember the devastation of the AIDS epidemic, lack of concern because of the advent of life-extending AIDS-treatment drugs, and burnout from years of safe-sex warnings. Other reasons for the increase include persons at risk are not diagnosed early enough and pass the infection to others before they know they have HIV, and the difficulty of HIV+ persons adhering to complex HIV drug regimens. There were 16,371 AIDS deaths in 2002—a 5.9% decline from 2001.

[These statistics indicate the need for more prevention efforts aimed at gay and bisexual men. One strategy announced by the CDC involves providing money to community groups in large cities that have had outbreaks of sexually transmitted diseases, such as syphilis and AIDS (July 29, 2003: <http://www.cdc.gov>). (*End of update by R. T. Francoeur*)]

### [HIV/AIDS among Latinos and Latinas

MIGUEL A. PÉREZ and HELDA L. PINZÓN-PÉREZ

[*Update 2003*: According to the CDC, the proportional distribution of AIDS cases in the United States has shifted among U.S. ethnic groups. Gender, cultural factors, perceptions of HIV/AIDS and/or stigma associated with AIDS, perceptions of the quality and availability of services, among other factors, have a tremendous impact on behaviors that put Latinos at risk for infection.

[While the rates have decreased among whites, the number of cases among Latinos has increased accordingly. In 1996, Latinos accounted for 17.3% of all male AIDS cases in the United States; that figure had increased to 19% by 2000 (CDC 1996; CDC 2002). As of June 1998, Latino men accounted for 18%, and Latinas 20%, of the cumulative AIDS cases, respectively (CDC 1998). Table 20 shows the proportion of AIDS cases among ethnic groups in the U.S. and contrasts that to the proportion of the population they represent.

[Latinos in their reproductive years seem to be at a great risk for HIV infection. In addition to the known risk factors for HIV infection (see Table 21), risk factors for Latinos include poverty, lack of access to healthcare, sexual roles,

and socioeconomic factors (Blasini-Caceres & Cook 1997; Keeling 1993).

[The data show an increase in the number of HIV and AIDS cases among Latinas in the United States. A comparison by gender and ethnicity is found in Table 22. In fact, intravenous drug use and sexual contact with men seem to be the primary transmission modes for Latino women (Blasini-Caceres & Cook 1997). Weeks and colleagues (1995) concluded that, although the number of heterosexual cases is increasing among Latinas, the number of AIDS-prevention programs geared towards them continues to be inadequate.

[Among Latinos, Puerto Ricans have the highest incidence of HIV infection. Puerto Ricans also have the fourth-highest rate in the nation (NCLR 1992). According to the Centers for Disease Control and Prevention (1993), up to 70% of AIDS cases are related to intravenous drug use in Puerto Rico.

[Studies among Latinos have yielded different results in regard to awareness about HIV/AIDS. Dawson (1990) reported that 41% of Latinos said they had some knowledge about AIDS, compared to 39% for African-Americans and 48% for European-Americans. However, less than half (48%) of Latinos understood the connection between HIV and AIDS, compared to 69% among European-Americans. These figures did not vary greatly two years later, when Schoenborn, Marsh, and Hardy (1994) reported that 40% of Latinos, 47% of European-Americans, and 39% of African-Americans had “some” knowledge about AIDS. In a study of Latinos, Miller, Guarnaccia, and Fasina (2002) found lower knowledge levels about AIDS among individuals with lower acculturation levels and whose primary language was Spanish. The same study found that Latinos were knowledgeable about general facts and about transmission modes.

[Latinos are less likely than other ethnic groups to accurately identify HIV-transmission modes. Alcalay, Sniderman, Mitchell, and Griffin (1990) found that Latinos were more likely (36%) than European-Americans (15%) to believe they could get AIDS from blood donations. The same study found that Latinos were more likely than non-Latinos to believe that HIV transmission could occur through casual contact (e.g., hugging or from water fountains). Dawson (1990) found that 7% of Latinos believed it was “very likely” they could become infected with HIV by eating at a restaurant where the cook had AIDS, compared to 5% of European-American respondents. The researchers also found that 19% of Latinos believed they could catch AIDS from an unclean public toilet, whereas only 8% of the European-American respondents and 10% of African-Americans believed this to be an exposure category. In 2002, Miller, Guarnaccia, and Fasina found that Latinos could correctly identify transmission modes regardless of acculturation level.

[Knowledge about AIDS seems to be related to language preference among some Latinos. Research indicates that Spanish-speaking Latinos are more likely than bilingual Latinos to believe AIDS is spread through casual contact (Hu

**Table 20**

### 2000 AIDS Cases in the U.S. by Population Group

	Percentage of AIDS Cases	Percentage of Estimated Population
Whites	32%	71%
African-Americans	47	12
Hispanics/Latinos	19	13
Asian-Americans	1	4
Native Americans	< 1	1

Source: CDC 2002

**Table 21**

### Adult Male AIDS Cases by Exposure Category

	White Non-Hispanic	Black Non-Hispanic	Hispanic
Men who have sex with men (MSM)	68%	27%	35%
Injection drug use (IDU)	12	36	36
MSM and IDU	8	6	5
Heterosexual contact	5	16	13
Other/Not identified	7	16	11

Source: CDC 2002

**Table 22**

### 2000 AIDS Cases in the U.S. by Gender

	Female	Male
Whites	1,895	11,466
African-Americans	6,545	13,218
Hispanics/Latinos	1,855	6,285
Asian-Americans	77	300
Native Americans	68	135

Source: CDC 2002

& Keller 1989). Another survey found that 24.1% of Spanish-speaking Latinos answered positively to the question, "Do you believe that one can catch AIDS from shaking hands with someone who has AIDS?" in comparison to 1.7% of English-speaking Latinos (Alcalay, Sniderman, Mitchell, & Griffin 1990).

[Hu and Keller (1989) found that, despite their lesser knowledge about AIDS, Spanish-speaking Latinos reported a higher interest in learning about AIDS (88%) than English-speaking groups (83%). Pérez and Fennelly (1996) found that Latino farm workers are willing to learn about AIDS, even though their reluctance to discuss sex has not decreased. One might expect that lower levels of knowledge about HIV/AIDS among Latinos in the United States would lead to more discrimination towards persons with AIDS. Instead, Alcalay et al. (1990) found no differences between Latinos and non-Hispanics in their likelihood to support AIDS victims' rights. (*End of update by M. A. Pérez and H. L. Pinzón-Pérez*)]

### C. HIV/AIDS: Five Specific Emerging Issues

LINDA L. HENDRIXSON

#### *AIDS as a Family Dilemma*

As the AIDS pandemic continues through its second decade in the United States, unforeseen issues have emerged as important considerations in attempts to meet the needs of people living with AIDS (PLWAs).

What began as a disease syndrome affecting individuals has become a problem which confronts whole families in America. Researchers, health providers, and policymakers have had to re-work their approaches to take into account the impact that AIDS has on family members, both immediate and extended. Our definition of "family" has undergone much change throughout this pandemic. As we consider the people who care for PLWAs, and those who care about them, family has come to be defined much more broadly than before. The family of origin has been replaced or extended to include non-blood-related friends, lovers, AIDS buddies, and others who provide emotional and instrumental support.

For many PLWAs, estrangement from birth families is a way-of-life. AIDS exacerbates those earlier problems. Others become estranged after their diagnosis is discovered. Families who have not disclosed the illness of their family member live with fear of ostracism and discrimination. If an AIDS diagnosis is kept secret within the family, social isolation becomes a continuing problem. Family pressures escalate if children are involved, especially if those children are infected. The financial strain of caring for adults and/or children with AIDS can be considerable. Finding competent doctors is an additional serious challenge throughout the country. Medical costs, health insurance, adequate health-care, and social support, caregiving, child custody, disclosure, stigma, discrimination, loss, and grieving are among the troubling issues facing families and others living with AIDS (Macklin 1989).

#### *Emerging Populations and Changing Locales*

AIDS is no longer found in what were originally perceived to be the only affected American AIDS populations—white, middle-class gay men and minority intravenous drug users in the inner cities (Voeller 1991; Wiener 1991). AIDS is now found in:

- people who live in rural locations;
- middle- and upper-class women, many of whom do not misuse drugs or alcohol;
- women who have only vaginal sex with men;
- women who have rectal sex with men, but do not report this behavior;

- women who have received contaminated donor semen;
- women who have had oral sex with other women;
- middle- and upper-class men;
- men who have only vaginal sex with women, and do not have sex with other men;
- black, Hispanic, and Asian gay and bisexual men;
- teenagers who have been sexually abused as children;
- people who use drugs, such as heroin, but do not use needles;
- athletes who use contaminated needles while injecting illegal steroids;
- women with blood-clotting disorders;
- people who have received contaminated organ transplants and other body tissues;
- senior citizens; and
- babies who nurse from infected mothers.

There is no longer a statistically precise AIDS profile or pattern. To a great extent, epidemiological categories have become meaningless.

The spread of AIDS to rural and small-town locations is worth noting. Most people still equate AIDS with major urban areas, and, true, the numbers of cases are highest there. However, the pandemic has diffused from urban epicenters, past suburbia, and into small, rural enclaves in the U.S. (Cleveland & Davenport 1989) The spread of AIDS in Africa along truck routes, as men seek sex away from home, is not unlike the spread of AIDS along major highways in the U.S., as people travel in and out of metropolitan AIDS epicenters. The government is paying little attention to rural AIDS in America; it is the least understood and least researched part of our national epidemic, with numbers of infected rising dramatically.

Limited research shows that some PLWAs who left their rural birthplaces for life in the city, are now returning to their rural families to be cared for. But many PLWAs who grew up in cities are leaving their urban birthplaces and moving to the country where they believe it is healthier for them, mentally and physically. This is especially true for recovering addicts whose city friends have died of AIDS, and who hope to escape a similar fate.

Besides the "in-migration" of people with AIDS to rural locations, there are many indigenous people in small towns who are infected as well. The numbers of cases of HIV/AIDS is increasing rapidly in rural America, where social services are inadequate, medical care is generally poor, and community denial is a reality. Federal and state monies continue to be channeled to inner-city agencies, leaving rural and small-town providers with scant resources to ease increasing caseloads (Hendrixson 1996).

#### *Complexion of the Pandemic*

The face of AIDS is changing in other ways, as well. There is now a considerable number of infected people who have outlived medical predictions about their morbidity and mortality. These are divided into two groups: asymptomatic non-progressors, and long-term survivors. Both groups test HIV-antibody-positive, indicating past infection with human immunodeficiency virus.

Despite being HIV-antibody-positive, the first group shows no other laboratory or clinical symptoms of HIV disease. The second group has experienced immune suppression and some opportunistic infections, and is diagnosed as having AIDS, but continues to live beyond its expected lifespan (Laurence 1994). In addition, there are others who are inexplicably uncharacteristic:

- people who have been diagnosed with AIDS, but who do not test HIV-antibody-positive, meaning that there is no

indication of previous exposure to the virus, despite their illnesses;

- people who have “retro-converted” from testing HIV-antibody-positive to now testing HIV-antibody-negative; and
- people who are repeatedly exposed to HIV through sex or contaminated blood and who do not become infected.

Scientists have no explanation for these anomalies. Little research has been done on people who do not fit the accustomed pattern physicians look for. Yet, the very fact that they challenge medical expectations is a clue that they hold answers that may help thousands of others in this country.

In many ways, some new drug treatments have helped infected people forestall serious illnesses, turning AIDS into more of a chronic than an acute-illness syndrome. Yet many PLWAs have renounced AZT and other toxic antiretroviral drugs, because of their serious side effects. Increasing numbers of patients are embracing alternative therapies—physical, mental, and spiritual—rather than taking potent AIDS drugs. Others are combining the best of conventional and unconventional medicine in their own self-styled treatment plans. The new protease inhibitors offer much promise, but it is too early to know what side effects they may produce. The bottom line is that AIDS no longer automatically equates with death (“The End of AIDS” 1996).

#### *HIV-Positive Children Coming of Age*

As life is extended, more and more children born with the virus are moving through late childhood and early adolescence in relatively good physical health. New challenges await them and their families. Some children may know they are infected with HIV; others may not. They continue to grow socially, with sexual feelings beginning to emerge. How do we help them fit in with their uninfected peers? How do we teach them about their sexuality? How do we prepare them for dating situations? What do we say when they speak of marriage hopes? How do we teach them about safer sex? What new approaches in HIV/AIDS education should health teachers consider as these children enter their classes? Parents, teachers, and youth leaders are wrestling with new questions that were unanticipated ten years ago when we believed that HIV-antibody-positive children would not live much beyond toddlerhood.

#### *New Paradigms, New Theories*

At least one revolutionary theory about AIDS is gaining prominence, as a cure for the syndrome continues to elude us. Dr. Peter Duesberg, a cancer geneticist, virologist, and molecular biologist at the University of California-Berkeley, and a member of the elite National Academy of Sciences, along with other well-established scientists, has challenged the standard medical and scientific HIV hypothesis. He maintains that AIDS researchers have never definitively proven that HIV alone causes AIDS. He theorizes that HIV cannot be the sole cause of such a complex cascade of physiological events as the complete suppression of the entire human immune system, eventually leading to fatal opportunistic infections and conditions such as cancer and dementia.

Duesberg, one of the first scientists to discover retroviruses, the family of viruses to which HIV belongs, contends that HIV is a benign “carrier” retrovirus which a healthy immune system inactivates as it would any intruder. HIV antibodies result from this normal defense response. Being HIV-antibody-positive only means that a person’s immune system is working properly. It does not mean that the person will develop AIDS.

Duesberg and others believe that the serious immune suppression which manifests as severely lowered T-cell counts and opportunistic infections that may become fatal,

can result from one or more of the following factors, all of which are immune-suppressive:

- continuous, long-term misuse of legal and illegal recreational drugs, including sexual aphrodisiacs such as nitrite inhalants, used by men to facilitate rectal sex with other men;
- over-use of prescription drugs, including antibiotics, antivirals, and anti-parasitics, often taken for repeated sexually transmitted infections;
- toxic effects of AZT and other antiretroviral drugs, which are intended to interfere with cell DNA replication (“DNA chain terminators”), and, therefore, kill *all* body cells without discrimination;
- malnutrition, which often accompanies long-term illicit drug and alcohol use; or
- untreated sexual diseases and other recurring illnesses, which also suppress immunity.

One or a combination of these factors eventually brings on the potentially fatal condition which the CDC arbitrarily calls “AIDS.”

Duesberg points to the number of people with AIDS who do not test HIV-antibody-positive, as well as those who are HIV-antibody-positive but are not symptomatic. He questions why scientists are not interested in studying these people who defy the accepted AIDS dogma. Duesberg’s efforts to have his research papers published by the mainstream American scientific press, to present his views at scientific AIDS conferences, and to be awarded funding to do additional AIDS research have met with virtual failure in this country.

Duesberg (1996) has been shut out by the powerful medical/scientific establishment which pretends to be open to new ideas and theories, but which, he maintains, is chained to the HIV-equals-AIDS hypothesis. He presented his challenge in a 1996 book titled *Inventing the AIDS Virus*.

#### *Conclusion*

In the 15th year of the AIDS pandemic, we have no cure and no vaccine for this disease. Thousands have died in our country, most of them young people. Thousands more have died in other countries. New advances in drug treatments and alternative/holistic modalities have helped some American PLWAs, but many families continue to silently mourn the death of their loved ones. The stigma of AIDS is ever-present; the fear continues. Yet, compassion and love have emerged, as well, as caring people reach out to help those who are suffering. AIDS appears to have “dug in” for the long term while science looks for answers. In the meanwhile, we need to ask two questions. First, as scientists search for the truth of AIDS, are they asking the right questions? Second, as the disease shifts from its former pattern of early, premature death to a more manageable long-term chronic illness, are we meeting the needs of all the people infected and affected by this disease—PLWAs, their families, and their loved ones?

#### **D. The Impact of AIDS on Our Perception of Sexuality**

RAYMOND J. NOONAN

Little has been written on the impact that AIDS has had and continues to have on our collective sensibilities about sexuality and our innate needs to express aspects of our sexual selves. Research has been sparse, if nonexistent, on the various meanings ascribed—both by professionals in the sexual sciences and members of the general public—to either sexuality itself or to the disease complex of AIDS.

Professionals in any field often serve to support and maintain the various cultural norms of any given society.

As such, with the exception of the safety-valve role of those who might be referred to as the “loyal opposition,” rarely are there expressions of sentiments or ideas that seriously challenge widely held beliefs and assumptions. Within the various disciplines encompassing the sexual sciences, the struggling theory, for example, that HIV may not be the direct cause of AIDS (see previous section), is one of the few examples of such reassessments. Among the popular press, nevertheless, various accounts have sporadically appeared with critical appraisals of either our general or specific approaches to current AIDS perspectives, including Farber (1993, 1993ab), Fumento (1990), Patton (1990), and others.

### Current Trends

It cannot be denied that AIDS is a serious, debilitating, and potentially deadly disease. Yet, the American response to it has often been one in which the reality of the disease, as well as myths promoted as facts, have been appropriated to further some related or unrelated political aim. Metaphorical allusions are often used to discuss the issue, not to impart factual information about or to motivate persons to AIDS prevention, but to further a political agenda or even to attack some political group(s) perceived as adversaries. Such political goals and targets have included:

- claims that AIDS is God’s punishment for sexual impropriety made by some homophobic religious leaders and others;
- instituting and promoting sex education by supporters;
- the promotion of male contraceptive responsibility by some health and sexuality professionals;
- AIDS used as a scare tactic to discourage sexual activity, particularly among the young, by some parents and others;
- providing the “scientific” reason for postponing sexual activity, being more selective about who one’s sexual partners are, and reducing the number of sexual partners, by some educational, political, and health authorities;
- the promotion of monogamy and abstinence;
- the promotion of community and solidarity among compatriots, from gays to fundamentalist Christians, who perceive they are under attack;
- the use of AIDS to promote anti-male, anti-white, and/or anti-Western attitudes; and
- the advocacy of some noncoital sex practices to communicate covert negative (heterophobic) views of heterosexuality and penile-vaginal intercourse (see Noonan 1996, 182-185).

For most sexologists and sexuality educators, the co-opting of the issues of protection and responsibility, especially for young people, reflects the intrinsically good part of human nature that seeks to find the “silver lining” in the dark cloud of HIV/AIDS. Although these political goals and targets probably do not apply to all people who are concerned about HIV/AIDS, these philosophies have had a more profound effect on overall public and professional approaches to sexuality and related issues than the number of their supporters would suggest. Some examples follow.

Although it is well known that anal intercourse offers the most effective way for HIV to be transmitted sexually, and that vaginal-penile intercourse is far less risky, rarely have investigators asked those whose infections are suspected to have been heterosexually transmitted, particularly women, whether and how often they engaged in anal intercourse. Instead, heterosexually transmitted HIV infections are assumed to be vaginally transmitted, although this is generally unlikely on the individual scale, and not likely to result

in an HIV epidemic in the heterosexual population (Brody 1995; National Research Council 1993).

Concentrating only on the condom for both contraception and STD/AIDS prevention ignores the effectiveness of spermicidal agents with nonoxynol-9 in the prevention of pregnancy and infection as a reasonable alternative for couples who object to condom use (North 1990) (see Table 18 in Section 9A on contraception). It also ignores the negative impact condoms have on sexual intimacy for some couples (Juran 1995).

In addition, our terminology with respect to AIDS has had a profound impact on our perception of sexuality. For example, the well-known slogan, “When you sleep with someone, you are having sex with everyone she or he has slept with for the last x-number of years,” is believed to be literally true by many people. The effectiveness of this slogan is seriously undermined when questions are raised about the kind of statistical and/or epidemiological evidence available to support this statement. To many, such slogans imply a view of sexuality that denigrates *all* sexual experiences, no matter how valid or valuable they are or have been. The “epidemic” of AIDS is another phrase that many, if not most, people believe to be literally true. They fail to realize that the word is being used in its metaphorical sense, with its emotional connotations being more important than its literal truth. The same can be said for the statement, “Everyone is equally at risk for AIDS.” Granted this statement is true, but only in the trivial sense that we are all, as mortal human beings, prone to sickness and death. The fact that ethnic and racial minorities in the U.S. are disproportionately represented in the AIDS and HIV-positive statistics (CDC 1996) should dispel that myth completely. Brandt (1988) has insightfully analyzed the notion of AIDS-as-metaphor:

At a moment when the dangers of promiscuous sex are being emphasized, it suggests that every *single* sexual encounter is a promiscuous encounter. . . . As anonymous sex is being questioned, this metaphor suggests that no matter how well known a partner may be, the relationship is *anonymous*. Finally, the metaphor implies to heterosexuals that if they are having sex with their partner’s (heterosexual) partners, they are in fact engaging in homosexual acts. In this view, every sexual act becomes a homosexual encounter. (p. 77, emphasis in original)

In fact, our very use of the terms “safe” or “safer sex” implies that all sex is dangerous, when in fact it usually is not (Noonan 1996a).

It is typical within American culture to ignore the chronic problems that result from the general American uncomfortableness with sexuality and sexual pleasure. In terms of responding to the health issues surrounding AIDS, Americans have two choices:

1. We can continue to respond as we have to other sexual issues, by spotlighting them and ignoring the broader issues of sane healthy sexuality, which includes the celebration of sexual intimacy and pleasure. This narrow panic response is typical of American culture and its dealing with such issues as teenage pregnancy, child sexual abuse, satanic ritual practices, sexual “promiscuity,” the “threats” to heterosexual marriage and the family posed by recognition of same-sex marriages, and the “epidemics” of herpes and heterosexual AIDS; or
2. We can respond to the AIDS crisis within the context of positive broad-based accommodation to radical changes in American sexual behavior and relation-

ships. This broad-based, sex-positive approach could well include: the availability of comprehensive, more affordable, and more reliable sexual-health and STD evaluations for men, comparable to the regularly scheduled gynecological exams generally encouraged for women; the development of effective alternatives to the condom, including the availability of effective male contraceptives that are separated from the sexual act of intercourse, easy to use, and reliable; making birth control as automatic for men as the pill has been for women (ideally, they would also work to prevent STDs); the expansion of research to make all contraceptives safe for both women and men; the elimination of fear as a method to induce the suppression of sexual behavior; and sex-positive encouragement for making affirmative intentional decisions to have sex, in addition to the “traditional” support for deciding not to do so (Noonan 1996a).

At this time, it remains unclear whether the American response to AIDS will follow its customary pattern of initial panic in the mass media, followed by a benign neglect and silence prompted by our traditional discomfort with sex-positive values, or whether this country will, at long last, confront the issue of AIDS, and deal with it in the broader context of a safe, sane, and healthy celebration of sexuality.

## 11. Sexual Dysfunctions, Counseling, and Therapies

### A. Brief History of American Sexual Therapy

WILLIAM HARTMAN and MARILYN FITHIAN

The scientific study of sexual dysfunctions and the development of therapeutic modalities in the United States started with Robert Latou Dickinson (1861-1950). Born and educated in Germany and Switzerland, he earned his medical degree in New York and began collecting sex histories from his patients in 1890. In the course of his practice, he gathered 5,200 case histories of female patients—married and single, lesbian and heterosexual—and published extensively on sexual problems of women (Brecher 1979; Dickinson & Beam 1931, 1934; Dickinson & Person 1925).

The turn-of-the-century popularity of Sigmund Freud’s psychoanalysis strongly influenced early American sexual therapy. Although its popularity has faded significantly, the psychoanalytic model is still practiced or integrated with other modalities by some therapists working with sexual problems. The 1948 and 1953 Alfred Kinsey studies brought an increased awareness of human sexuality as a subject of scientific investigation that could include the treatment of sexual disorders as part of psychiatry and medicine. The pioneering work of Joseph Wolpe and Arnold Lazarus (1966) in adapting behavioral therapy, shifted sexual therapy away from the analytical and medical model, as therapists began to view dysfunctional sexual behavior as the result of learned responses that can be modified.

William Masters and Virginia Johnson began their epoch-making study of the anatomy and physiology of human sexual response in 1964. Their initial research with 312 males and 382 females, published as *Human Sexual Response* (1966), remains the keystone of modern sex therapy, not just in the United States, but anywhere sex therapy is studied or practiced. *Human Sexual Inadequacy* followed in 1970. Masters and Johnson used a male-female dual-therapy team, and a brief, intensive, reeducation process that involved behavior-oriented exercises like sensate focus. It appeared to be highly successful because they worked with a select population of healthy people in basically solid relationships. After their success with relatively simple cases,

they and other therapists began to encounter more difficult cases, which could not be solved with the original behavioral approach.

In the early 1970s, Joseph LoPiccolo advocated the use of additional approaches designed to reduce anxiety within the behavioral therapy model suggested by Masters and Johnson (LoPiccolo & LoPiccolo 1978; LoPiccolo & Lobitz 1973; Lobitz & LoPiccolo 1972). LoPiccolo’s (1978) analysis of the theoretical basis for sexual therapy identified seven major underlying elements in every sex therapy model: 1. mutual responsibility, 2. information, education, and permission giving, 3. attitude change, 4. anxiety reduction, 5. communication and feedback, 6. intervention in destructive sex roles, lifestyles, and family interaction, and 7. prescribing changes in sex therapy.

John Gagnon and William Simon (1973) stressed the importance of addressing social scripting in sex therapy. Harold Lief, a physician and family therapist, pointed out the importance of nonsexual interpersonal issues and communications problems as factors in sexual difficulties. Lief (1963, 1965) also advocated incorporating the principles of marital therapy into sex therapy. As therapists began to integrate other modes of psychotherapy, such as cognitive, gestalt, and imagery therapies, it soon became apparent that there was no single “official” form of sex therapy. In addition, some sex therapists became sensitive to the impact and influence of ethnic values on some sexual problems (McGoldrick et al. 1982).

Helen Singer Kaplan, a psychiatrist at Cornell University College of Medicine, made an important and profound contribution to sex therapy when she blended traditional concepts from psychotherapy and psychoanalysis with cognitive psychology and behavioral therapy. Kaplan’s *New Sex Therapy* (1974) explored the role of such important therapeutic issues as resistance, repression, and unconscious motivations in sex therapy. This new approach focused not only on altering behavior with techniques like the sensate-focus exercises, but also with exploring and modifying covert or unconscious thought patterns and motivations that may underlie a sexual difficulty (Kaplan 1974, 1979, 1983).

Specific areas of sexual therapy have been developed, including Lonnie Barbach’s (1980) and Betty Dodson’s (1987) independent work with nonorgasmic women, Bernard Apfelbaum and Dean Dauw’s use of surrogates in their work with single persons, William Hartman and Marilyn Fithian’s (1972) integration of films, body imagery, and body work with dysfunctional couples, and Bernie Zilbergeld’s (1978, 1992) focus on male sexual health and problems.

There have been no major innovative treatments developed in sex therapy programs in recent years, although new refinements continue to occur. Some would comment that one does not have to reinvent the wheel when the results are good, but the early success rates have declined as the presenting problems have become more complicated and difficult to treat. Nevertheless, self-reported success rates from reputable sex therapy clinics run between 80% and 92%. However, critical reviews of sex therapy treatment models emphasize the paucity of scientific data in determining the effectiveness of such programs.

Today, few professionals who counsel clients with sexual difficulties see themselves as pure sex therapists. More and more, the term “sex therapy” refers to a focus of intervention, rather than to a distinctive and exclusive technique. Individual psychologists, psychotherapists, marriage counselors, and family therapists may be more or less skilled in providing counseling and applying therapeutic modalities appropriate to specific sexual problems, but each tends to

apply those interventions and techniques with which they are more comfortable. The American Association of Sex Educators, Counselors, and Therapists and the American Board of Sexology each examine and certify treatment professionals' knowledge of human sexual functioning as well as their skills in treating sexual dysfunctions. Board-certified therapists, counselors, and physicians are likely to be a more reliable treatment resource.

Informal support groups also provide opportunities for dealing with sexual problems and difficulties. Many hospitals and service organizations provide workshops and support groups for patients recovering from heart attacks, and persons with diabetes, emphysema, multiple sclerosis, cystic fibrosis, arthritis, and other chronic diseases. These support groups usually include both patients and their partners.

## B. Current Status 2003

JULIAN SLOWINSKI, WILLIAM R. STAYTON,  
and ROBERT W. HATFIELD [*Updated  
August 2003 by R. W. Hatfield*]

Recently, American sex therapy has incorporated important advances in medicine and pharmacology. More-precise knowledge and techniques now allow a therapist to develop a hormone profile for a patient, monitor nocturnal penile tumescence, and check penile and vaginal blood flow. With patients now more likely to report negative side effects of medications on their sexual responses, physicians have developed strategies for altering the course of medication. New surgical methods improve penile blood supply. Moreover, prosthetics, vacuum devices, oral medications, and other aids, like injections, urethral suppositories, and electrical devices to stimulate erection, have been developed.

Breakthroughs are also occurring in female sex research with direct implications for sex therapy. Examples include the efforts of sex-affirming women to redefine sexual satisfaction in women's terms and to expand our appreciation of the spectrum of erotic/sexual responses beyond the phallic/coital (Ogden 1995), Joanne Loulan's (1984) exploration of lesbian sexual archetypes, sexual responses of women with a spinal cord injury, the effects on women's libido of homeopathics to increase the bioavailability of testosterone, and work combining testosterone with estrogen replacement to increase both sexual desire and pleasure in perimenopausal women. One sidelight in this exciting female sex research is that the old methods of sensate focus and pleasuring exercises are still working successfully. For example, the self-help materials are still very useful in working with preorgasmic women. The traditional sensate-focus exercises are still effective in working with desire and orgasm issues, painful intercourse, and vaginal spasms.

More good news are the trends in treating male sexual dysfunction today. For the motivated and cooperative male, there is treatment for virtually every dysfunction. In addition to the ever-helpful sensate-focus exercises, we have medications for increasing desire and arousal, such as yohimbe, a bark extract of the African tree yohimbe, and a combination of green oat and palmetto-grass extract. These are available through a physician's prescription, at health food stores, or through mail-order catalogs. As of mid-1995, there is enthusiastic anecdotal feedback from individual therapists who are using yohimbe and oat extract with their clients; but what is anxiously awaited—and needed—in this area are the results of controlled clinical studies to document the actual therapeutic effects, if any.

The vacuum pump for erections has been much improved with automatic monitoring of blood flow. With some clients, penile injections produce remarkable results. Monoxdydyl and nitroglycerin are being used as topical

preparations, as are prostaglandin E1 suppositories inserted into the urethral meatus. Taken alone, these medications are seldom effective in the long term. Without therapy, the person will often misuse or stop using the medication or method. However, when sex therapy is added, the success rate increases dramatically, because both the relationship and the dysfunction are being treated.

[*Update 2003*: Unquestionably, the 1998 introduction of Viagra (sildenafil citrate) oral pharmacological treatment for erectile dysfunction by the Pfizer Corporation heralded the greatest public focus on sexual dysfunctions since the 1965 Masters and Johnson publication of *Human Sexual Response*. Public awareness of this new drug came so suddenly that just one year after its introduction, the Viagra name was added to the *Oxford English Dictionary*. By 2002, over 20 million men (and a few women) had been prescribed more than one billion tablets retailing for \$6.00 or more per tablet. Pfizer reported 2002 sales of Viagra at \$1.7 billion. Just a few years earlier, Pfizer had projected that sales would be \$4.5 billion (Simons 2003). Although the medication is reported to be effective for as high as 70% of the men who try it, it appears that the human intricacies of sexual response and sexual relationships were not accounted for by the drug companies. Many men experiencing problems with erection did not suddenly become expert lovers or experience increased pleasure in their relationships with Viagra alone. In 2003, three additional drug company giants entered the market to compete with Pfizer. Bayer and GlaxoSmithKline are co-marketing Levitra (vardenafil HCL), with the Eli Lilly company due to introduce their entry (in late 2003 or early 2004) into the erectile-dysfunction-medication market with a drug called Cialis (tadalafil). TAP Pharmaceuticals will be introducing Uprima (apomorphine), also in 2003 or 2004. Five years of Viagra marketing (over \$100 million per year), and the anticipated expenditure of many hundreds of millions of additional dollars by Pfizer's new competition, will certainly bring with it added sex information and misinformation, symptom relief and frustration, and other ambivalent reactions to drug effects and side-effects.

[When an effective treatment for a male sexual dysfunction is discovered, it is invariably applied to women. The success of the vacuum device on erectile dysfunction has led to a female clitoral suction device called the Eros Clitoral Pump. Adequate research to determine the true effectiveness of this device has yet to be published. Human studies of attempts to treat female sexual dysfunctions with Viagra have not been encouraging, but given the relative financial success of Viagra, some drug companies are hoping for another breakthrough medication, this time for female sexual problems. (*End of update by R. W. Hatfield*)]

## Problems

Several problems currently impede the delivery of sex therapy to clients. Primary among these is the state of flux in the insurance industry (third-party payers) with the shift toward managed care, health maintenance organizations, and provider networks. The availability of third-party payment makes it much more feasible for patients to avail themselves of sex therapy. The insurance industry has changed the entire healthcare-provider field by creating the impression that therapists, like others in the medical field, are not to be trusted to know how long therapy should last, or what methods should be used to treat psychodynamic problems. This has created the image that all psychological problems can be treated by brief therapy within a predetermined number of sessions or merely with medications. The insurance industry has also made confidentiality problematic, because clients must sign away some rights to confidentiality

in order to receive mental-health coverage, although the 2003 federal HIPAA regulations regarding patient records improved this situation somewhat. Increasingly, insurance plans refuse to pay for sex therapy. This has prompted many therapists to give a diagnosis that is acceptable to the plan, but not necessarily the most accurate diagnosis.

Secondly, the rise of the religious right appears to have had a negative impact on sex therapy in America. Although there has been no general decline in premarital sex in America, the "abstinence-only until marriage" ethic can be a considerable barrier to normal adolescent sexual rehearsal explorations for some people, and may well result in an increased likelihood of dysfunction when newlywed couples confront their sexuality and sexual functioning on the wedding night. Masters and Johnson, as well as several other researchers, have discovered that a high level of religious orthodoxy is significantly related to greater incidence of sexual dysfunction. Two responses are likely: The individuals and/or couple may become so stressed that it is difficult for them to function naturally within the permitted circumstances, or they may rebel even before marriage and get involved in promiscuous and/or risky practices.

A third concern is a growing challenge as to whether sex therapy is even a separate discipline. There are those who believe that sex therapy needs to be subsumed under psychology, marriage and family therapy, social work, or psychiatry. The fact is that few of these disciplines have educational or training programs that teach about the healthy aspects of sex and sexuality or the creative treatment of sexual problems.

Finally, the amount of money and effort given to research on female sexuality significantly lags behind research on male sexuality (di Mauro 1995).

Because humans are born sexual but not lovers, sex therapy is increasingly seen as including good sex education, good medicine, and good psychotherapy/counseling. In the last ten years, sex therapy has added important concerns related to gender-identity dysphoria, sexual (gender) orientations, and lifestyle issues.

[*The Field of Sex Therapy* ROBERT W. HATFIELD

[*Update 2003*: One might expect that the decades following the 1970 birth of sex therapy as a profession would be characterized by ever-improving research into treatment methods, expansion of graduate programs designed to train sex therapists, and an increasing number of highly trained sex therapists available to those individuals and couples suffering from sexual problems and dysfunctions. The reality in the new millennium is much the opposite. There are only half as many board-certified sex therapists in 2003 than there were in the mid-1980s, and while recent surveys indicate that the actual prevalence of sexual disorders in the U.S. is probably higher than we ever previously believed, the number of medical schools and helping-professions graduate schools that provide basic sexuality education and training in the treatment of sexual dysfunctions is significantly fewer than in the 1980s.

[Today, those professionals available to the person or couple who seeks help come from a fragmented collection of specialties that rarely communicate with each other. That's not the way it began.

[A few noble professional organizations in the field of sexology were created over the past 45 years to be multidisciplinary groups of highly trained physicians, psychotherapists, social scientists, biologists, and many others who began to share their unique perspectives and knowledge to further the growth of the field. However, in 2003, while there are a larger number of sexology professional

groups than ever before, most are increasingly specialized, and almost all report fewer members each year.

[It seems counterintuitive that sex therapy as a field of study and as a profession is today in such disarray. There is no single explanation for the current situation. Knowledgeable scientists and clinicians have observed that useful theory regarding normal sexual functioning never coalesced; that early treatment methods avoided the complexity of the human sexual experience and focused almost exclusively on symptom elimination; that shifting corporate structures and vacillating national economies that could not or would not deal effectively with healthcare led to a rigid managed-care system that quickly limited or eliminated services such as counseling or therapy directed at intimate relationship issues; and, most recently, the rapid medicalization of the field of treating sexual problems by prescribing simple pharmacological or biomechanical interventions that appear to be much more economical.

[It is expected that the trends away from health-insurance support of sex therapy and the growth of the number of new sex drugs and devices will continue. The only signs that sex therapy may get a second wind of fresh research and new treatment methods while addressing its theory deficiencies is a very recent trend where several of the professional organizations are beginning to communicate and even collaborate with each other. The number of researchers, academicians, and clinicians who have true expertise in some area(s) of sexology is very small. It is fairly obvious to most expert observers that the field is much too small to survive the layers of fragmentation that have occurred over the past few decades. (*End of update by R. W. Hatfield*)]

### *Psychotropic Drugs*

JULIAN SLOWINSKI, WILLIAM R. STAYTON,  
and ROBERT W. HATFIELD

[*Update 2003*: Antidepressants, antianxiety, and anti-panic medications are being used in conjunction with psychotherapy in treating desire-, excitement-, and orgasm-phase problems, as well as paraphilic obsessive-compulsive behaviors (Coleman 2002). Studies are demonstrating that the most commonly prescribed category of antidepressant medications, SSRIs, can be useful in treating specific sexual disorders. A side effect of SSRIs, such as Zoloft, Paxil, and Prozac, is a predictable increase in the latency time for ejaculation by 3 to 5 minutes. While this can be an unwanted and frustrating side effect for some men, it has been beneficial for others who present with problems of ejaculatory control (early ejaculation). For women, SSRIs may have the similar unwanted side effect of increasing the latency to orgasm. Both genders who experience this medication side effect as unwanted can become frustrated in their sexual interactions, with frustration and distraction causing a loss of arousal or desire leading to the possibility of an iatrogenic sexual dysfunction. Behavioral sex therapy techniques to treat premature ejaculation are generally highly successful, but studies have shown that for those men who do not respond to these interventions, a relatively low dose of an SSRI medication is usually therapeutic. Interestingly, a majority of these medicated men maintained good ejaculatory control following a brief (2- to 3-month) use of the SSRI. For the others, discontinuation of the medication resulted in a return of the premature-ejaculation symptoms. This finding suggests the possible presence in some men of high levels of performance anxiety, relationship problems, or a constitutional tendency towards difficulty with ejaculation control.

[There have been encouraging findings (Coleman 2002) with the use of a variety of psychoactive medications in the

treatment of certain types of compulsive sexual behaviors (CSB). A significant number of CSB patients have realized near or complete relief from sexual obsessions and compulsions when taking certain medications. The most frequently prescribed and studied of these are the SSRI medications. Since these same medications have been found to often be effective for other types of obsessive-compulsive disorders, it is hypothesized that the neurotransmitter serotonin is associated with the symptoms.

[An unfortunate side effect of SSRIs is the frequent complaint by patients of some loss of sexual desire. Certain formulations of the SSRI medications have been found to be more likely to cause unwanted sexual side effects than others. It seems that whenever a new SSRI has been approved for sale by the FDA, the drug company makes strong claims that their antidepressant causes fewer sexual side effects than the competition. Actual clinical experience with the new medication often does not support the corporate claims. Sometimes, changing from one SSRI formulation to another may result in a reduction or relief from a side effect, but in other cases, careful clinical experimentation with dosage, time of day medication is taken, or other medication-management efforts can have a beneficial effect. As previously stated, if the medication has the effect of merely slowing down typical sexual responsiveness, the patient may become overly frustrated and begin to avoid interactions. Also, because the possibility of sexual side effects with these types of medications are commonly known among the general public, there is a significant likelihood of an expectancy effect, where any perceived change in responsiveness is exaggerated by worry or anxiety that the medication is causing problems. This is unfortunate, since it is known that effective treatment of depression, anxiety, and obsessive-compulsive symptoms can result in a return to normal or near-normal libido. A great deal more high-quality research is needed to help us understand the complex interactions of medications and the biopsychosocial aspects of human sexual functioning. On the pharmacopoeia's horizon is the possibility of clinically useful true aphrodisiac drugs. Although such a class of medication would almost certainly be misused and abused, it could also offer relief to many who suffer from desire or arousal dysfunctions. (End of update by R. W. Hatfield)]

### *Vulvodynia, a Newly Identified Syndrome*

JULIAN SLOWINSKI

One of the new challenges facing American sex therapists and gynecologists today is the occurrence in many women of a painful burning sensation in the vulvar and vaginal area. This condition, recently named vulvodynia, or burning vulva syndrome, is a form of vestibulitis that can have a number of causes, from microorganisms that cause dermatosis to inflammation of the vestibular glands. The presenting complaint of these women is burning and painful intercourse. Some women develop secondary vaginismus. Discomfort varies from constant pain to localized spots highly sensitive to touch. In many cases, the psychological and relationship consequences are grave. Many women become depressed as a result and frustrated by attempts at treatment.

Current treatment includes topical preparations, laser surgery to ablate affected areas, dietary restrictions, and referral to a physical therapist to realign pelvic structure and reduce pressure on the spinal nerves serving the genital area. Some affected women have sought relief with acupuncture. Therapy may be enhanced by focusing on the effects of the condition on the sexual functioning of the patient, her relationship with her partner, and her self-image. Pain-reduction techniques, including self-hypnosis, have

proven valuable in some cases. Low doses of an antidepressant, including some SSRIs, may reduce the pain.

There is much work to be done in the treatment of vulvodynia, including making the public aware of this condition and educating physicians in the role that sex therapists can play in supporting these women and their partners.

### *The Medicalization of Sex Therapy*

JULIAN SLOWINSKI, WILLIAM R. STAYTON,  
and ROBERT W. HATFIELD [Updated  
August 2003 by R. W. Hatfield]

There is an increasing medicalization in sex therapy today. Although this may at first seem to benefit many patients—and it does—there is a concern among sex therapists that many conditions will be summarily treated through medications by primary physicians, with a corresponding failure to address the dynamic and interpersonal aspects of the patient. In short, there is a danger of incomplete evaluation of the patient's status if only the medical aspects are considered and the therapist is left out of the process. In the ideal situation, the sex therapist and physician would collaborate on the treatment plan, using medication as indicated.

[Update 2003: Even though Viagra sales have been substantial, they are less than half of the expected sales. It is apparent that Pfizer and their newly arriving corporate competitors from Bayer/GSK, TAP Pharmaceutical Products, and Eli Lilly see this failure by Pfizer to meet market expectations primarily as a mere marketing problem to be solved (Simons 2003).

[Cursory diagnosis and the simple prescription of sexual-response-enhancing drugs such as Viagra may be adequate for some individuals who are experiencing only or primarily an acute medical problem. Five years of clinical experience with Viagra is revealing that this approach is likely to be inadequate or even destructive when sexual dysfunction is associated with more-complex human factors, such as guilt, shame, fear, trauma, and significant relationship dysfunction. On a personal level, large numbers of couples and individuals are discovering the simple truth that healthy and pleasurable relationships are more complicated than erections and lubrication. Sadly, many who gain or regain physiological erectile functioning discover that emotional and relationship problems remain, and they end up feeling more hopeless about themselves or their relationship than they did before taking the medication. It is obvious that many of these people eventually give up, unaware that their problems and solutions to the problems could not be found at any pharmacy.

[Current trends are not encouraging. There has been little useful information making its way to the general public regarding truths about the utility of medications for sexual functioning. There is every indication that corporate interests among drug companies will increase the flood of advertising that simplistically asserts that their product will solve the problem. Hundreds of millions of dollars a year are and will be spent to convince physicians and the general public of this. The public does not want to hear that humans are complicated, and science has always been woefully inadequate in publicizing their complex findings in a useful manner. What some call corporate greed appears to cause some large drug companies nowadays to grossly distort or exaggerate the benefits and lack of harm of their prescription medications until the FDA eventually steps in. Lately, it has been observed that corporations that produce prescription and nonprescription sex pills have begun to invent fictitious diagnostic categories, such as "Female Sexual Dysfunction," and then claim that their product effectively treats, or even cures the problem.

[Additionally, there is an exploding trend, with the apparent discovery by a large number of smaller companies, that the FDA takes little or no notice if the product is not a prescription drug and is marketed in small print as a food product. Anyone who reads their email knows that there seems to be an endless number of companies that tout that their vitamin-herbal-mineral product will enlarge your breasts, penis, or scrotum, or greatly enhance your erections, lubrication, desire, staying power, and overall sexual performance and enjoyment. Billions of dollars are being made by mainstream and back-alley businesses on the sexual unhappiness, misunderstanding, ignorance, and suffering of a significant proportion of our population. We are in an unfortunate moment in history in which diagnosis and treatment decisions are removed from the expertise of science and medicine, and replaced by the corporate decisions of healthcare insurance providers and drug companies. There is no encouraging indication of hope on the horizon that any person, institution, professional organization, business, or government agency can or will step forward to protect and educate us. Fortunately, this is not true in all world cultures, but in most essential ways, the United States remains with two feet firmly mired in the dark ages on issues of human sexuality and sexual health. And unfortunately, unique aspects of our culture make solutions to these problems much more complex than the problems themselves. Known and needed changes in the areas of religiosity, education, business, childrearing, and government are likely to occur at a painfully slow pace. (*End of update by R. W. Hatfield*)]

#### [Incidence Rates PATRICIA BARTHALOW KOCH

[*Update 1998*: Although it is extremely difficult to ascertain accurately the occurrence of the various sexual disorders and dysfunctions in the United States, research on various clinical and community samples has provided a glimpse as to their prevalence (Spector & Carey 1990). Sexual desire problems are the most common complaint seen in sex therapy in the United States, with affected men outnumbering women. It is also the most common sexual complaint of lesbian couples (Nichols 1989). Community studies indicate that 16% to 34% of the population experiences inhibited sexual desire. Between 11% and 48% of the female population may experience arousal-phase disorder, whereas 4% to 9% of males report this disorder. Erectile disorder is the most common complaint of men, and inhibited orgasm is the most common complaint of women seeking sex therapy in the United States. It is estimated that 5% to 10% of women in the general population experiences persistent or recurrent inhibited orgasm. On the other hand, inhibited orgasm is one of the least common dysfunctions among American males (1% to 10%). It seems to be a more common difficulty among gay men than among heterosexual men, however. The most common dysfunction of heterosexual men is rapid ejaculation, with 36% to 38% reporting persistent or recurrent rapid ejaculation. Dyspareunia is much more common in women than men, with 8% to 23% of women experiencing genital pain. Yet, few lesbian women report this difficulty. Over 100 diseases and disorders of the urogenital system have been linked with painful intercourse. (*End of update by P. B. Koch*)]

#### [Culturally Appropriate Counseling and Therapy

PATRICIA BARTHALOW KOCH  
[*Update 1998*: Minority women and men in the United States experience the entire range of sexual problems and dysfunctions as those experienced by Anglo-Americans (Wyatt et al. 1978). However, most of the research has been conducted with samples of white, middle-class clients. This

has left a critical need for research regarding the effectiveness of various sex counseling and therapy techniques among males and females from various racial/ethnic groups (Christensen 1988).

[A primary issue is that most minority clients do not have the confidence in or financial resources for professional help and are most likely to turn to extended family or close friends—if anyone—with a sexual concern. Discussion of most sexual matters may be considered too intimate or shameful to discuss with anyone but a long-trusted confidante. People from minority groups may also have experienced prejudicial treatment from professionals in the dominant group that has led them to have mistrust, hostility, or expectations that their problem will not be understood. Thus, they usually come into contact with professionals only in a crisis when seeking help for legal, financial, reproductive, gynecological, or other medical problems, rather than for relationship or mental health issues.

[Professional helpers are overwhelmingly drawn from the white middle class and generally are middle-aged, and well educated (Atkinson et al. 1983). Their personal attitudes, values, and behaviors usually represent those of the dominant, more privileged culture. Unfortunately, the training of most sex counselors and therapists has not provided opportunities to become aware of and informed about the effects of gender, race/ethnicity, and class on their treatment of minority clients. Language barriers can be seriously problematic. Even when English is the primary language of therapist and client, an Anglo-American ethnocentrism may result in: misunderstanding, misdiagnosing, and/or mistreating a minority client's problem; trying to control aspects of the client's sexuality or fertility rather than helping him or her to make personally satisfying and culturally sensitive choices; or ignoring sources of help and support from within the client's culture (Christensen 1988; McGoldrick, Pearce, & Giordano 1982). The therapist may need to focus, not just on the individual, but also on the institutions and sexist/racist policies that may be affecting the client adversely (systemically induced dysfunction). (*End of update by P. B. Koch*)]

#### [Sexuality of Menopausal Women

PATRICIA BARTHALOW KOCH

[*Update 1998*: As America's baby boomers experience mid-life and older age, the sexual concerns of peri- and postmenopausal women have gained greater attention. Older women have been increasingly discussing sexual issues, along with their other health concerns (such as hot flashes, osteoporosis, and heart disease), with their physicians, and are turning to sex counselors and therapists for help. Some of the chief complaints experienced by mid-life heterosexual women are decreased sexual desire, decreased frequency and intensity of orgasm, and decreased frequency of sexual behaviors with a partner, although some women experience heightened sexual response and satisfaction during this time (Mansfield, Voda, & Koch 1995). Interestingly, mid-life lesbian women report less decline in sexual functioning and satisfaction than do their heterosexual peers (Cole 1988).

[Hormone replacement therapy (HRT) has been widely touted as a "miracle" drug to help women fight the "estrogen deficiency disease" of menopause and maintain their youth (e.g., smoother skin and elimination of hot flashes) and health (e.g., decreased risk of heart disease, osteoporosis, and perhaps Alzheimer's disease). However, others have addressed the naturalness of menopause and raised questions as to the actual and relative health risks involved with the use of HRT (such as increased breast cancer) (Love 1997). Regarding sexual functioning, estrogen seems to be important in maintaining vaginal lubrication and perhaps

vaginal vasocongestion, whereas testosterone seems to be important for the pleasurable sensations associated with sexual arousal (Anderson 1991). There are also natural ways to replace estrogen, such as a diet high in soy-based foods, and vaginal dryness may be reduced with a vaginal lubricant, such as K-Y jelly.

[It should not be assumed that sexual concerns of mid-life women are always related to hormonal menopausal changes, since various research studies have found no connection, or only a weak link, between sexual functioning and menopausal status (Mansfield, Voda, & Koch 1995). Growing older in our culture also creates difficulties for women, such as perceived loss of attractiveness and value, that can affect self-esteem and sexuality. Continued or new difficulties in an ongoing sexual relationship can precipitate sexual concerns. As women reach mid-life, they may become more assertive about having their needs met, rather than fulfilling the more traditional gender roles and male phallogocentric definitions of sexual satisfaction (Ehrenreich, Hass, & Jacobs 1987, 153; Ogden 1995). Indeed, a partner's ill health or declining sexual responsiveness may also affect the couple's sexual relationship. Thus, in diagnosing and treating a mid-life woman's sexual concerns, physiological, psychological, relational, and sociocultural factors should all be considered (Mansfield & Koch 1997). (*End of update by P. B. Koch*)]

#### [*Male Erectile Problems* ROBERT T. FRANCOEUR

[*Update 1998*: Throughout recorded history, impotence or erectile dysfunction (ED) has been a major concern of men, and the curing of this sexual dysfunction one of medicine's shadiest niches, populated by hundreds of bizarre remedies ranging from ground rhinoceros horns, boar gall, and tiger-penis soup to mail-ordered electrified jockstraps and a never-ending offer of magical pills containing no more than common vitamins and herbs.

[In 1966, inflatable and flexible penile implants were introduced, followed by surgery to boost penile arterial flow in 1973. In 1982, the Food and Drug Administration approved a vacuum pump that pulls blood into the penis by creating a vacuum around a sheathed penis. In the same year, a milestone demonstration by Giles Brindley, a British physician, opened a new door to a major medical breakthrough in the treatment of erectile dysfunction. On-stage at a medical conference in Las Vegas, Brindley demonstrated the result of injecting the penis with papaverine, a drug that lowers blood pressure. Several penile injection therapies were soon being tested and welcomed by patients, including: alprostadil; "cocktails" of papaverine, phentolamine, and prostaglandin E1; and phentolamine combined with the protein VIP. Urethral suppositories containing alprostadil were approved by the FDA in 1997. In 1998, pills containing sildenafil, apomorphine, and phentolamine were in various stages of testing and FDA approval (Stipp & Whitaker 1998).

[In December 1992, the National Institutes of Health convened a Consensus Development Conference to address the issue of male erectile dysfunction (National Institutes of Health 1992). Specific issues investigated included:

1. The prevalence and clinical, psychological, and social impact of erectile dysfunction;
2. The risk factors for erectile dysfunction and how they might be used in preventing its development;
3. The need for and appropriate diagnostic assessment and evaluation of patients with erectile dysfunction;
4. The efficacies and risks of behavioral, pharmacological, surgical, and other treatments for erectile dysfunction;

5. Strategies for improving public and professional awareness and knowledge of erectile dysfunction; and
6. Future directions for research in prevention, diagnosis, and management of erectile dysfunction.

Among their findings, the panel concluded that:

1. The term "erectile dysfunction" should replace the term "impotence";
2. The likelihood of erectile dysfunction increases with age, but is not an inevitable consequence of aging;
3. Embarrassment of patients and reluctance of both patients and healthcare providers to discuss sexual matters candidly contribute to underdiagnosis of erectile dysfunction;
4. Many cases of erectile dysfunction can be successfully managed with appropriately selected therapy;
5. The diagnosis and treatment of erectile dysfunction must be specific and responsive to the individual patient's needs, and compliance as well as the desires and expectations of both the patient and partner are important considerations in selecting appropriate therapy;
6. Education of healthcare providers and the public on aspects of human sexuality, sexual dysfunction, and the availability of successful treatments is essential; and
7. Erectile dysfunction is an important public health problem, deserving increased support for basic science investigation and applied research.

[In the early 1980s, an estimated 10 million Americans suffered from erectile dysfunction. In 1987, a federally funded survey, the Massachusetts Male Aging Study led by Boston University urologist Irwin Goldstein, provided evidence for NIH to triple the early estimate of erectile dysfunction to 30 million Americans.

[*Update 2003*: Pharmaceutical companies concerned about their public images and the stockholders' focus on the bottom line resulted in caution about entering this area, despite the enormous profit potential. That reticence quickly ended in April 1998 with the successful introduction of Viagra by the Pfizer Corporation. Today, several other major pharmaceutical companies are rushing to find and market "sex cures." While citizens can be hopeful that the drug companies will be more ethical than the shaman and snake-oil salesmen of the past and present, the state of corporate ethics as we move into the new millennium does not promote optimism.

[When Pfizer Pharmaceutical released the first erection pill in 1998, the initial demand by men—and women—for this prescription medication far exceeded the expected market. For many weeks after Viagra's release, television programs, newspapers, and magazines were filled with discussions of the erection pill, of other possible modes of delivery including a transdermal gel, and the use of this medication by both men and women. While early reports and discussions focused on the "miracle of better loving through chemistry," it quickly shifted to broader psychological and relationship repercussions, both beneficial and harmful, for both men and women who have lived with impotence for some time. Health insurance companies quickly moved to limit their coverage of the medication, leaving potential users wondering about the cost of \$6 to \$10 per pill and their ability to pay. At the same time, questions are being asked how the insurance companies can justify paying for the erection pill while they refuse to pay for the cost of the birth control pill and mammograms. Sex therapists, like Leonore Tiefer, have warned that the erection pill is yet another example of the tendency of Americans to medicalize sex and seek "magic bullet" therapy:

The primary disadvantage of medicalization is that it denies, obscures, and ignores the social causes. . . . [T]he spotlight directed on "the erection" within current medical practice isolates and diminishes the man even as it offers succor for his insecurity and loss of self-esteem. Erections are presented as understandable and manipulable in and of themselves, unhooked from person, script, or relationship (Tiefer 1995, 155, 167).

[Perhaps the early cautions and criticisms have been at least partially supported. By 2003, Viagra sales have been disappointing, with Pfizer realizing less than half the sales that they expected (Simons 2003).

[One beneficial effect of Viagra has been that discussion of men's problems with erections entered the public domain, where men can more openly admit their dysfunction and a desire to try the new medication. Similarly, their partners now feel freer to talk about the topic. This public discussion of erectile problems, like the open discussion of oral sex that followed allegations of sexual impropriety against President Clinton, may have a salubrious effect on American sexual life (Kaschak & Tiefer, 2001; Kleinplatz, 2001). (End of update by R. T. Francoeur, with R. W. Hatfield)]

### [C. Holistic and Touch Therapies

ERICA GOODSTONE

[Update 2003: In contrast to the increased medicalization of sex therapy in contemporary practice is the expanding use of various touch therapies and other holistic therapeutic modalities. These therapies typically seek to integrate the mind and the body and to focus on the person as a whole, with benefits that can extend to the relationship and other aspects of life.

[Touch has always been an integral part of sex therapy as originally created by Masters and Johnson (1970), i.e., touch between the two sexual partners as homework assignments, not usually in the office and not between the sex therapist and client. Typically, homework assignments involve only a few types of touch: sensate focus, touching and stroking erogenous body parts (including penis, vagina, and breast stimulation) as part of foreplay, and oral-genital stimulation, as well as specific techniques for specific dysfunctions, such as the stop/start and squeeze techniques for premature ejaculation, and vaginal stimulation or insertion of dilators to alleviate dyspareunia and vaginismus.

[Touch affects more than just sexual performance. Gentle and nurturing touch can resurrect desire and eliminate sexual dysfunctions by alleviating physical aches and pains, relaxing the body so that blood flow can increase, and calming the spectator mind. Touch therapy that does not involve sensual or sexual stimulation can actually open the door to sensual awareness, emotional expression, positive thinking, and, ultimately, more pleasurable and satisfying intimate love relationships.

[Studies of touch-therapy methods (massage therapy, acupuncture, acupressure, craniosacral therapy, reflexology, Therapeutic Touch, etc.) and body-psychotherapy modalities (bioenergetic analysis, Rubenfeld synergy, hakomi, etc.) have shown promising and impressive improvements in the functioning of clients suffering from physical and emotional illnesses, post-traumatic stress disorder, sexual abuse issues, and even sexual dysfunctions (see, e.g., <http://www.umi.com/hp/Products/Dissertations.html>; <http://www.amtamassage.org/publications/enhancing-health.htm#8>; <http://www.acupuncture.com>; <http://www.eabp.org>; <http://www.usabp.org>).

[Dr. Tiffany Field's Touch Research Institute at Jackson Memorial Hospital in Miami, Florida, and Dr. John

Upledger's Healthplex Center in Palm Beach Gardens, Florida, have amassed an impressive amount of data in studies of the benefits of their particular modalities, massage therapy and craniosacral therapy, respectively (<http://www.miami.edu/touch-research/>; <http://www.upledger.com/therapies/cst.htm>). Numerous studies, some conducted by the National Center for Complementary and Alternative Medicine of the National Institutes of Health (<http://www.nlm.nih.gov/nccam/camonpubmed.html>), have shown the healing benefits of massage, acupuncture, and acupressure. Many doctoral dissertations and other studies have focused on the benefits of Therapeutic Touch, a method developed by Dr. Delores Krieger, a nurse educator at New York University in New York City (<http://www.therapeutic-touch.org>; <http://www.phact.org/e/tt/>). Further research is needed to determine the effectiveness and benefits of the various modalities with respect to sexuality and sexual dysfunctions.

[The following simplified categorization of touch and holistic therapies indicates the enormous, largely untapped resources available to therapists and clients in the field of sex therapy.

#### [Traditional Massage, Swedish Massage, and Massage Therapy

[Massage is probably the best known, most thoroughly researched, and one of the few licensed methods of touch therapy in this country. Carefully draping the client's body with a sheet and towels, the therapist typically utilizes oils and creams, as well as herbal and aromatic essences, music, soft lighting, and basic massage strokes directly on the client's skin. The goal is usually to alleviate muscular tension, improve circulation, eliminate painful nerve constrictions, treat acute and chronic soft-tissue injuries and problems, and relieve stress by relaxing the mind and body.

#### [Contemporary Western Massage and Bodywork

[Expanding upon the practice of traditional massage therapy, these methods may include the use of water, ice, heat, chair massage, onsite massage, medical massage, sports massage, pregnancy massage, infant massage, and more recently, animal massage.

#### [Structural, Functional, Movement, and Alignment Therapies

[These methods of touch therapy (e.g., Alexander Technique, Feldenkrais, and Myofascial Release) utilize techniques to improve body alignment, organ functioning, flexibility of movement, hormonal balance, and integration of the body as a holographic system. These methods may involve actual re-sculpting of the connective tissue, improved flow of cerebral spinal fluid, lymph drainage, realignment of subluxated vertebrae, trigger-point release, or simply guiding the body to move in an easier, more fluid, and graceful manner.

#### [Asian Bodywork

[These methods of touch therapy (e.g., Acupuncture, Acupressure, Chi Gong, and Thai Massage) originated in different parts of Asia and are mostly derived from Traditional Chinese Medicine Theory. This ancient theory describes the health of the body in terms of the five basic elements (fire, water, earth, metal, and wood) and the functioning of the 12 pairs of primary meridians and the eight extraordinary meridians, lines of energy flowing in specific patterns throughout the body. Stimulating points along the meridians using finger, hand, foot, knee, or elbow pressure, and in some cases, fine needles, the goal is to release restrictions in the flow of energy (or *chi*) throughout the body.

*[Energetic Bodywork*

[These methods of touch therapy (e.g., Polarity Therapy, Reiki, and Chakra Healing) focus on the energetic fields within and surrounding the body. These methods range from direct contact on the skin, to indirect contact an inch to a foot or more above the body, to distant indirect contact from another room, another city, or anywhere on the planet. Training may be simple to complex, requiring anywhere from one weekend of basic training, to several years of ongoing instruction, to a secretive initiation process open to only a select number of students.

*[Somatic and Expressive Arts Therapies*

[These methods include body-centered therapies that may or may not involve actual touch. Through movement, dance, sports, yoga postures, martial arts, dramatic performances, artistic expression, and visualization, as well as through hands-on touch, the body may allow us to express emotions and feel sensations that have previously been unavailable to our conscious minds. Some practitioners are trained artists, some have received training in one or more body-therapy methods, while others are graduates of accredited academic programs.

*[Body Psychotherapy*

[The common element of all body-psychotherapy methods (e.g., Rubenfeld Synergy, Bioenergetic Analysis, Core Energetics, and Reichian Therapy) is the focus on body awareness and the judicious use of touch during the psychotherapeutic session. The touch may vary from very gentle and respectful of the client's needs to more-forceful touch focused on breaking through defenses and body armoring. A body-psychotherapy session may include guided imagery, focused breathing, role playing, movement, expressive arts, as well as emotional release work. Body psychotherapists are trained and certified in both psychotherapy and body-therapy methods or in specific body-psychotherapy modalities.

[Current sex therapists may choose to study a particular body-therapy modality and enroll in a training program to learn how to use touch therapy in combination with their counseling and therapy techniques—and then apply this knowledge and understanding to the practice of sex therapy. Without any additional training, however, sex therapists can employ the services of qualified, certified, and/or licensed body-therapy practitioners as an adjunctive and associative practice with some of their clients.

[Further information can be obtained at the Center for Loving Touch website, <http://www.sexualreawakening.com>. Here you will find links to many of the major body-therapy and body-psychotherapy organizations, including the U.S. Association for Body Psychotherapy. (*End of update by E. Goodstone*)]

**D. Education and Certification of Sex Therapists**

JULIAN SLOWINSKI and WILLIAM R. STAYTON

Since American sex educators, counselors, and therapists are not licensed by any government agency, reputable professionals in the field operate under one of several traditional professional licenses as part of their practice as a physician, psychologist, psychoanalyst, social worker, marriage and family counselor, or pastoral counselor.

The American Association of Sex Educators, Counselors, and Therapists (AASECT) does offer its own certification for sex educators, counselors, and therapists following successful completion of specified training programs that include supervised practice. Continuing education credits are required for renewal of this certification.

**E. Sex Surrogates: The Continuing Controversy**

RAYMOND J. NOONAN [*Updated by R. J. Noonan*]

Three decades after Masters and Johnson pioneered modern sex therapy, the use of sexual partner surrogates, despite a long history of controversy, continues, largely because it has been found by some professionals to be an effective therapeutic modality in certain circumstances for persons without partners and for specially challenged persons with physical limitations. Still, as Dauw (1988) has noted, little in-depth research has been conducted about surrogates, their effectiveness, or their appropriateness in working with specific sexual dysfunctions. Misconceptions about surrogates are widespread (Apfelbaum 1984), in part, because of a common confusion between the roles of sex surrogates and prostitutes, based on the potential for intimate sexual interaction and the surrogate being paid for her or his work. Roberts (1981) has suggested that “the most common misconception” is of the surrogate as “an elitist type of prostitute.” In addition, some authors have commented on the effects of media accounts of sex surrogates, which have tended to focus on the bizarre, the sensational, and even the untrue (Braun 1975; Lily 1977).

The distinction commonly noted between surrogates and prostitutes usually relies on the intent of the sexual interaction: the prostitute's intent being immediate gratification localized on genital pleasure, whereas the surrogate's intent is long-term therapeutic reeducation and reorientation of inadequate capabilities of functioning or relating sexually (Brown 1981; Jacobs et al. 1975; Roberts 1981). In 1970, Masters and Johnson noted that “. . . so much more is needed and demanded from a substitute partner than effectiveness of purely physical sexual performance that to use prostitutes would have been at best clinically unsuccessful and at worst psychologically disastrous.”

[*Update 2003*: IPISA, the International Professional Surrogates Association (<http://members.aol.com/Ipsa1/home.html>), remains the organization most involved with surrogate partner therapy, primarily training new surrogates and educating the public and professionals about its potential benefits (Vaughan 2004). (*End of update by R. J. Noonan*)] In describing the therapeutic process, IPISA (n.d.) wrote,

A surrogate partner is a member of a three-way therapeutic team consisting of therapist, client and surrogate partner. The surrogate participates, as a partner to the client, in experiential exercises designed to build the client's skills in the areas of physical and emotional intimacy. This partner work includes exercises in communication, relaxation, sensual and sexual touching and social skills training.

Others, including Allen (1978), Apfelbaum (1977, 1984), Brown (1981), Dauw (1988), Masters and Johnson (1970), Roberts (1981), Symonds (1973), Williams (1978), and Wolfe (1978) have described, either briefly or in part, typical surrogate sessions or alternative models. According to Jacobs, et al. (1975): “The usual therapeutic approach is slow and thorough. Exercises are graduated and concentrate on body awareness, relaxation and sensual/sexual experiences that are primarily non-genital.” Where appropriate, the surrogate also teaches “vital social skills and traditional courtship patterns which finally include sexual interaction.” However, none of these writers gave a perspective of the relative amount of time or importance that each aspect of the surrogate therapy session or program places on the entire process. Such a perspective would give a clearer understanding of the true functions of a sex surrogate that would allow the integration of the use of surrogate therapy into a

useful theoretical perspective relative to clinical sexuality, as well as to normative sexual functioning.

The use of sex surrogates was introduced by Masters and Johnson (1970) as a way to treat single men who did not have partners available to participate in their couple-oriented sex-therapy program. As the practice evolved, surrogates sometimes specialized in working with specific populations, such as single heterosexual or homosexual men, with couples as a coach, or with people with physical disabilities.

Today, the use of surrogates remains controversial with complex legal, moral, ethical, professional, and clinical implications. [*Update 2003*: As of mid-2003, surrogate partner therapy, when performed under the supervision of a licensed therapist, is completely legal throughout the U.S. (Vaughan 2004). (*End of update by R. J. Noonan*)] Although Masters and Johnson eventually abandoned the practice (Redlich 1977), the use of professional sex surrogates has been ethically permissible as part of the sex therapist's armamentarium, according to the American Association of Sex Educators, Counselors, and Therapists (AASECT 1978, 1987). Still, a recent version of AASECT's (1993) *Code of Ethics* ceased to mention the use of surrogates explicitly. Instead, the 1993 code merely stated that a member of AASECT should not make a "referral to an unqualified or incompetent person" (p. 14), which would presumably refer to surrogates, among others.

In their 1987 *Code of Ethics*, however, and in at least one earlier version, AASECT addressed the issue of surrogates directly, and promulgated the parameters for their ethical use, including the understanding that the surrogate is not a sex therapist or psychotherapist, and that the therapist must protect the dignity and welfare of both the client and the surrogate. In addition, it outlined how issues of confidentiality and consent should be addressed. In many ways, this document is similar in putting the client's welfare first to the *Code of Ethics* espoused by the International Professional Surrogates Association (IPSA 1989). Among IPSA's strict requirements for members are the necessity that surrogates practice only within the context of the therapeutic triangle consisting of the client, surrogate, and supervising therapist, that the relationship with the client always be within the context of the therapy, that the surrogate recognize and act in accordance with the boundaries and limitations of her competence, and that the surrogate be responsible for all precautions against pregnancy and disease. Confidentiality and continuing-education requirements are also among the 17 items listed in the code, although the surrogate's primary role as a cotherapist or substitute partner in any given therapeutic situation is left open to agreement between the therapist and surrogate.

In 1997, there were estimated to be fewer than 200 surrogates worldwide, according to Vena Blanchard, president of IPSA (personal communication, March 15, 1997), with maybe 100 practicing in the U.S.A. [*Update 2003*: As of mid-2003, Blanchard estimated that there were fewer than 100 practicing surrogates in the country (Vaughan 2004). (*End of update by R. J. Noonan*)] These numbers are down by about two thirds from the 300 estimated to be practicing in the U.S. in 1983-1984 (Noonan 1995/1984), a time when the number of surrogates peaked. However, the downward trend of the subsequent decade, caused primarily by fears surrounding AIDS, has been showing signs of reversing since the mid-1990s, according to Blanchard, who pointed to the number of new surrogates being trained and requesting training by IPSA. Still, according to Blanchard, only a few urban areas, primarily on the two coasts (mostly in California), have surrogates working, with most of the country not being served.

Noonan (1995/1984) surveyed 54 sex surrogates who were part of a surrogates' networking mailing list representing about 65 to 70% of all known legitimate trained surrogates in 1983-1984. The 54 surrogate respondents represented about 36% of the 150 estimated known surrogates, who were estimated to be approximately one half of all surrogates practicing in the U.S. at the time. In addition to demographic data, the instrument asked respondents to estimate the percentage of time they spent in each of seven activities with clients. The data gathered seemed to support strongly the hypothesis that sex surrogates provide more than sexual service for their clients, spending about 87% of their professional time doing nonsexual activities. In addition to functioning as a sexual intimate, Noonan found that the surrogate functions as educator, counselor, and cotherapist, providing sex education, sex counseling, social-skills education, coping-skills counseling, emotional support, sensuality and relaxation education and coaching, and self-awareness education. The results indicated that a majority of time is spent outside of the sexual realm, suggesting further that surrogate therapy employs a more holistic methodological approach than previous writings, both professional and lay, would seem to indicate. Clearly, the sex surrogate functions far beyond the realm of the prostitute.

Specifically, Noonan's (1995/1984) results showed that the surrogate spends much of her or his time talking with the client, with approximately 34% of the time spent giving sexual information, as well as reassurance and support. Almost one half of the surrogate's time (48.5%) is spent in experiential exercises involving the body nonsexually, with the majority of that time devoted to teaching the client basically how to feel—how to be aware of what is coming in through the senses. Combining the two averages, we find that the surrogate typically spends 82.5% of the therapeutic time enhancing the cognitive, emotional, and sensual worlds of the client. Only after this foundation is developed does the surrogate spend almost 13% of the time focusing on erotic activities, including sexual intercourse, cunnilingus, and fellatio, and teaching sexual techniques. The remaining 4.5% focuses on social skills in public settings, clearly the least important aspect of what the surrogate deals with.

Finally, a profile emerged of the "average" sex surrogate in 1983-1984: she is a white female, in her late 30s/early 40s, and not very religious. She is one way or another single with 1.4 children, college-educated, lives in California, has been practicing as a surrogate for four years three months, and sees 27 clients per year. Finally, she is a heterosexual who does not need to concern herself or her partner with chemical or mechanical methods of contraception, because she has been sterilized (Noonan 1995/1984). It is interesting to note that among the 54 respondents, six of the surrogates had earned doctorates, with the average being a bachelor's degree plus some advanced study, indicating the atypically high level of educational achievement in this group.

### *Present and Future Issues*

Surrogate therapy has no doubt changed somewhat over the past two decades for various reasons. These changes need to be elucidated, documented, and incorporated into our collective knowledge about normative sexuality and how to address the various problems we have created or maintained around its expression.

Since 1983, the impact of AIDS has become a deep concern of both surrogates and therapists. Exactly how it has affected the work of surrogates remains to be studied. Certainly in the years immediately following Noonan's (1995/1984) study of the functions of sex surrogates, many surrogates, who in retrospect were not particularly at risk for HIV

infection, stopped practicing or modified their practice as surrogates out of fear. Many therapists also stopped referring clients to surrogates out of fear of legal liability. As the reality of HIV infection has become better known, surrogates, who are mostly female working with heterosexual males, are continuing to help clients function better sexually while promoting responsible sexual behavior at all levels. [*Update 2003*: A recent report indicated that some surrogates began to focus on integrating safer sex and condom use into the therapy to help clients more effectively deal with the new reality, which continues today (Vaughan 2004). In addition, given the current emphasis on pharmacological treatment of some sexual dysfunctions, it remains to be seen what kind of impact this will have on surrogate therapy, especially in light of the fact that such dysfunctions are likely to increase with the greying of America. (*End of update by R. J. Noonan*)] Little or no research exists that has investigated how gay male surrogates, who worked mostly with gay male clients in the 1980s, have changed their practice.

Since the 1980s, women have become more aware of how surrogates might help them effectively deal with various sexual dysfunctions. Some female clients will ask their therapists, or seek out therapists who are open to the possibility, to find a male surrogate with whom they might work. Largely because of the sexual double standard that continues to operate in many, if not most, therapists, however, most clients of surrogates continue to be male. The degree to which women have begun to work with surrogates to solve their sexual problems, or who consider it a viable option, are questions that require additional research. In addition, the differences that may exist in the design of the therapy program itself and how a female client might work with a surrogate, as compared to how males work with surrogates, is also a topic open to research. It appears that heterosexual male surrogates remain today the rarest of sex surrogates, as in the early 1980s.

Despite these research needs, the population of surrogates is likely to remain resistant to study, both because of the legal ambiguities often involved with their practice and the fact that the use of surrogates retains a relatively high visibility in public consciousness, although surrogates themselves are usually quite invisible. Because they are a small group, they will be difficult to study with any reasonable assurances of confidentiality.

The most troubling aspect of research on sex surrogates may be the indication, yet to be verified by any research, that there are probably many more surrogates working with clients and therapists in the United States, who are independently trained by varying standards by the therapists with whom they may be working, and who are both isolated from other surrogates and from researchers. This leaves them unaware of the most recent knowledge and advances in the field, because rarely are therapists trained in working with surrogates. It also deprives us of the knowledge gained from experience that these "hidden" surrogates may have learned.

## 12. Sex Research and Advanced Professional Education

### A. A Research Assessment ROBERT T. FRANCOEUR

The United States has a long tradition and unequalled wealth of sexological research. The survey work of Alfred Kinsey and his colleagues in the 1940s and 1950s and the clinical/therapeutic research of William Masters and Virginia Johnson are but tips of the iceberg, referred to and cited in almost any discussion of sexological research anywhere in the world (Brecher 1979; Bullough 1994; Pomeroy 1972).

Sexological research in the United States today is vital to the management of many social and public health problems. Each year, one million teenage girls become pregnant, a per-thousand-rate twice that of Canada, England, and Sweden, and ten times that of the Netherlands; the disproportion is similar for teenage abortions (Jones et al. 1986). The nation spends \$25 billion on families begun by teenagers for social, health, and welfare services. One million Americans are HIV-positive and almost one quarter of a million have died of AIDS. Yet only one in ten American children receives sexuality education that includes information about HIV/AIDS transmission and prevention. One in five adolescent girls in grades 8 through 11 is subject to sexual harassment, while three quarters of girls under age 14 who have had sexual relations have been raped. These and other public health problems are well documented and increasingly understood in the context of poverty, family trauma, ethnic discrimination, lack of educational opportunities, and inadequate health services. However, there is little recognition of the need for sexological research to deal effectively with these problems. Congress has several times refused or withdrawn funding for well-designed and important surveys because of pressure from conservative minorities (di Mauro 1995).

In 1995, the Sexuality Research Assessment Project of the Social Science Research Council (605 Third Avenue, 17th Floor, New York, New York 10158) published a comprehensive review of *Sexuality Research in the United States: An Assessment of the Social and Behavioral Sciences* (di Mauro 1995). This report identified and described major gaps and needs in American sexological research. There is a serious lack of a framework for the analysis of sexual behaviors in the context of society and culture. This framework is needed to examine how sexual socialization occurs in families, schools, the media, and peer groups, and to address the complex perspectives of different situations, populations, and cultural communities. Areas of need identified by the project include: gender, HIV/AIDS, adolescent sexuality, sexual orientation, sexual coercion, and research methodology. Three major barriers hindering sexuality research are 1. the lack of comprehensive research training in sexuality, 2. inadequate mechanisms and efforts to disseminate research findings to policymakers, advocates, practitioners, and program representatives in diverse communities who need this information, and 3. the lack of federal, private-sector, and academic funding for research.

### [Gender Differences in Sex Research

RAYMOND J. NOONAN

[*Update 2003*: A perplexing problem that has repeatedly emerged in sex surveys of men and women regarding their sexual attitudes and behavior is the differing levels of sexual activities that each sex tends to report. Males tend to report higher levels of various sexual activities with greater sexual permissiveness than do females, which tends to reflect cultural gender-role expectations. This has led to such anomalies as heterosexual men reporting more sexual partners than heterosexual women do, which one would expect to be statistically equivalent. Thus, the limitations of self-reports become a salient question affecting the validity of any results, as well as public policy based on them. One possible explanation suggested that men overreported their sexual partners, activities, and so on, and women underreported them to accommodate society's double standard.

Alexander and Fisher (2003) sought to shed some light on this question through the imaginative use of a research technique called the "bogus pipeline," in which they asked men and women questions in written surveys about their sexual attitudes and behaviors under the false belief that

their truthfulness could be detected (in this case, by being attached to a polygraph that was actually non-functioning). Results were compared with those of two groups, one in which the testing was anonymous (but without the belief that truthfulness was detectable), and one in which there was the possibility that someone might see the answers (the “exposure threat”).

Although the results were not as clear as expected, they indicated that under the exposure-threat conditions, answers reflecting traditional sex differences with respect to sexual behaviors were more likely, whereas when they thought their truthfulness could be detected, the women’s and men’s responses were more similar. In fact, the responses of the women were generally more exaggerated than the men’s, meaning their sexual activity was greater than normally found in surveys, which was attributed to the fact that women have greater expectations to respond and be perceived in socially appropriate ways (Alexander & Fisher 2003). Thus, women and men may be more similar than different, and further research needs to clarify these findings, as well as have them applied to future research on sexual behaviors. (*End of update by R. J. Noonan*)

## B. Advanced Sexological Institutes, Organizations, and Publications

MARTHA CORNOG and ROBERT T. FRANCOEUR  
*[Rewritten and updated in August 2003 by  
 M. Cornog and R. T. Francoeur]*

### *Advanced Sexuality Education and Institutes*

The longest-established American sexological research institution is the Kinsey Institute for Research in Sex, Gender, and Reproduction, based at the University of Indiana, Bloomington, Indiana (<http://www.kinseyinstitute.org>). Another major, younger institution is the Institute for the Advanced Study of Human Sexuality (IASHS; address: 1525 Franklin Street, San Francisco, CA 94109, <http://www.iashs.edu>), which has its own degree program—see below. Two additional key organizations focus strongly on sexual research and public policy: the Sexuality Information and Education Council of the U.S. (SIECUS; address: 130 West 42nd Street, Suite 350, New York, NY 10036, <http://www.siecus.org>), and the Planned Parenthood Federation of America (PPFA; address of headquarters: 434 West 33rd Street, New York, NY 10001, <http://www.ppfa.org>).

The libraries of the Kinsey Institute and the IASHS both have extensive collections on sexuality, including research, policy, and erotica. The SIECUS and PPFA libraries also have significant holdings, as does California State University at Northridge (CSUN) with its Vern and Bonnie Bullough Collection on Human Sexuality. A more complete selection of libraries specializing in sexuality topics, including homosexuality, may be found via the index to the *Directory of Special Libraries and Information Centers* (Gale Research).

A number of U.S. universities grant degrees with majors or concentrations in sexology and/or sex education, counseling, and therapy. Extensive listings of all types of educational programs of all types is available from the Society for the Scientific Study of Sexuality (<http://www.sexscience.org>; click on “Resources” and then on “Educational Opportunities”), and at the Kinsey Institute website (<http://www.kinseyinstitute.org>).

- *The Alfred Kinsey Institute for Research in Sex, Gender, and Reproduction* and the University of Indiana in Bloomington offer an undergraduate individualized major in human sexuality, a doctoral minor in human sexuality through the Kinsey Institute, and a doctoral minor and undergraduate interdisciplinary major in Gender Studies.

- *The Institute for the Advanced Study of Human Sexuality*, now in its 27th year, offers five graduate degree programs and five certificate programs for those wishing academic and professional training in human sexuality, specifically for persons who intend to make the field of human sexuality a major focus in their professional careers. On-site and distance learning courses are scheduled so as to accommodate the busy professional. The Institute is home of the most comprehensive sexological library in the world, the result of more than 27 years of archival research and efforts to obtain the rights for the reproduction of film and other materials for student use. The library system contains more than 75,000 books, 150,000 magazines, journals, and pamphlets, 50,000 videotapes, 200,000 films, and more than 900,000 photographs and slides. The Institute’s degree programs and certificate programs have been approved and registered by the California Bureau for Private Postsecondary and Vocational Education (BPPVE). For further information, contact: <http://www.iashs.edu> or 415-928-1133.
- *California State University in Northridge* offers an interdisciplinary minor in Human Sexuality through the College of Social and Behavioral Sciences. CSUN is also the base for the College of Social and Behavioral Sciences’ Center for Sex Research (<http://www.csun.edu/~sr2022/>) and the extensive Vern and Bonnie Bullough Library Collection on Human Sexuality. Contact: Coordinator, Dept. of Family Environmental Sciences, 18111 Nordhoff St., Northridge, CA 91330.
- *University of Minnesota Program in Human Sexuality*, the only American graduate program with an endowed chair in Human Sexuality, and the Department of Family Practice and Community Health offer educational opportunities in medical school education, academic courses, continuing education, Sexual Attitude Reassessment (SAR), and a post-doctoral clinical/research fellowship. Contact: <http://www.med.umn.edu/fp/phs/phspostd.htm>.
- *Columbia University School of Public Health*, New York, NY, offers a Sexuality and Health track, an interdepartmental program, jointly created and delivered by the Departments of Population and Family Health and of Sociomedical Sciences, leading to a master in public health (M.P.H.) degree.
- *San Francisco State University* (San Francisco, CA), offers an undergraduate minor and a master of arts degree in Human Sexuality Studies in the Human Sexuality Studies Program, to provide students with knowledge about processes and variations in sexual cultures, sexual identity and gender-role formation, and the social, cultural, historical, and ethical foundations of sexuality, intimate relationships, and sexual health. Contact: SFSU, Human Sexuality Studies Program, 1600 Holloway Avenue, San Francisco, CA 94132; tel.: 415-405-3570; <http://www.sfsu.edu/~bulletin/current/programs/humsexst.htm>.
- *Widener University’s Center for Education, School of Human Service Professions*, in Chester, PA, offers master’s and doctoral programs in Human Sexuality Education. The program continues the tradition of the graduate program at the University of Pennsylvania (where it operated the past 20 years). Clergy, educators, counselors, and others who wish to become certified sex educators, to do counseling or therapy, to get advanced training, or to engage in sex research may apply. Contact: Program Coordinator, Human Sexuality Education, 987 Old Eagle School Road, Ste. 719, Wayne, PA 19087; tel.: 610-971-0700; William.R.Stayton@widener.edu.
- *The American Academy of Clinical Sexologists* (AACS), headed by Dr. William Granzig at Maimonides Univer-

sity in North Miami Beach, Florida, offers mental health counselors, clinical social workers, marriage and family counselors, and psychologists a two-semester program leading to certification in sex therapy, and a doctoral degree program in clinical sexology. For those who wish to practice sex therapy, a program of continuing education in certain sexological subjects, which, when certain other requirements are met, qualify a graduate student for state certification as a sex therapist. Students may also qualify for a doctor of philosophy degree in Clinical Sexology by combining the two semesters of certification study with an additional four semesters of study and completion of a doctoral dissertation. Contact: <http://www.esextherapy.com>; tel.: 407-645-1641. For the program on Long Island, NY, contact: [womenc@aol.com](mailto:womenc@aol.com).

- *Universite du Quebec au Montreal* (UQAM), in Montreal, Quebec, Canada, offers North America's undergraduate and master's-level degrees in *Sexologie*. The program has over 25 full-time faculty in a wide range of disciplines. All instruction is in French.
- *University of Guelph* (Guelph, Ontario, Canada) offers graduate programs, summer course workshops, and an annual institute through the Department of Family Relations and Applied Nutrition.

In the late 1960s, several American medical schools introduced programs in human sexuality into their curricula for training physicians. These programs reached their zenith in the early 1980s. By the late 1980s, many of them were under fire from newly appointed conservative administrators and threatened with cutbacks and elimination. Indications suggest a significant decline in sexuality training for physicians and other healthcare professionals, but the picture is not clear, because no one has studied the situation nationwide. (See Richard Cross' comments in Section C below.)

Two East Coast institutes are focused on the interconnection of sexuality and religion:

- Religious Institute on Sexual Morality, Justice, and Healing, 304 Main Avenue, #335, Norwalk, CT 06851; tel.: 203-840-1148; <http://www.religiousinstitute.org>.
- Center for Sexuality and Religion, 987 Old Eagle School Road, Suite 719, Wayne, PA 19087; tel.: 610-995-0341; <http://www.ctrsr.org>.

### Sexological Organizations

There are three major American sexological membership organizations:

- The American Association of Sex Educators, Counselors, and Therapists (AASECT). Founded in 1967; currently around 1,500 members. Address: P.O. Box 5488, Richmond, VA 23220; <http://www.aasect.org>.
- The Society for the Scientific Study of Sexuality (SSSS). Founded in 1957; currently around 1,000 members. Address: P.O. Box 416, Allentown, PA 18105; <http://www.sexscience.org>.
- The Society for Sex Therapy and Research (SSTAR). Founded in 1974; currently about 200 members. Address: 409 12th Street NW, P.O. Box 96920, Washington, DC 20090; <http://www.sstarnet.org>.

Several dozen other groups exist for various types of professionals concerned with sex-related issues. Typical among these are: the Association for the Behavioral Treatment of Sexual Abusers, the Association of Nurses in AIDS Care, the National Council on Family Relations, the Society for the Philosophy of Sex and Love, and the Society for the Psychological Study of Lesbian, Gay, and Bisexual Issues.

At least 100 U.S. advocacy and common-interest organizations deal in one way or another with advocacy for gay and lesbian viewpoints or provide a vehicle for the gay and lesbian practitioners of a profession or hobby to socialize or work together. Among the largest and most comprehensive are the Lambda Legal Defense and Education Fund, the National Gay and Lesbian Task Force, and Parents, Families, and Friends of Lesbians and Gays, each with 15,000 or more member/contributors and budgets in the millions of dollars. Typical of smaller special-interest groups are: Federal Lesbians and Gays (federal government workers), Gay and Lesbian Medical Association, Good Gay Poets, International Association of Gay and Lesbian Martial Artists, International Gay and Lesbian Travel Association, and Lesbian and Gay Bands of America.

Similar organizations exist in America for many sexual viewpoints and behaviors other than homosexuality—and for sexual matters perceived as problems. An all-too-brief sampling from the 40th edition of the *Encyclopedia of Associations* (the *EoA*, from Gale Research Publications) includes: Adult Video Association (pro-pornography/erotica), Americans for Decency, American Sunbathing Association (nudism), DC Feminists Against Pornography, Eagle Forum, Focus on the Family, Impotents Anonymous, National Association of People with AIDS, North American Swing Club Association and the Lifestyles Organization (both recreational nonmonogamy), Renaissance Transgender Association, Sex Worker Foundation for Art, Culture, and Education, Sexaholics Anonymous, Society for the Second Self (Tri-Ess, for transvestites), and Women Exploited by Abortion. Browse the *EoA* index under subjects like “sex,” “AIDS,” and so on, for more organizations.

Other, often-small special-interest groups may not be listed in the *EoA* but can be located by scanning sex-related websites and publications like *The Black Book*, edited by Bill Brent and Lori Selke (Black Books, <http://www.blackbooks.com>). Such groups include DPF (Diaper Pail Friends: infantilism and nepiophilia, <http://www.dpf.com>), the National Association of Rubberists (rubber or latex fetish, <http://www.rubberist.net>), and the Society of Janus (sodomasochism, <http://www.soj.com>).

### Sexological Journals and Publications

U.S.-published professional journals that focus on sexuality-related research and commentary include: *Archives of Sexual Behavior*, *Annual Review of Sex Research*, *Electronic Journal of Human Sexuality*, *Journal of Bisexuality*, *Journal of Child Sexual Abuse*, *Journal of Gay and Lesbian Psychotherapy*, *Journal of the Gay and Lesbian Medical Association*, *Journal of Gender Studies*, *Journal of the History of Sexuality*, *Journal of Homosexuality*, *Journal of Lesbian Studies*, *Journal of Marriage and Family*, *Journal of Psychology and Human Sexuality*, *Journal of Sex and Marital Therapy*, *Journal of Sex Research*, *Journal of Sex and Aggression*, *Marriage and Family Review*, *Journal of the History of Sexuality*, *Maledicta* (language), *Sexuality and Culture*, *Sexuality and Disability*, and *SIECUS Report*. This is not an exhaustive list; consult periodical directories at a public or university library for other titles.

For identifying U.S. national and local gay and lesbian newspapers and magazines, consult the most recent annual edition of *Gayellow Pages* (Renaissance House). A less comprehensive and less frequent, but quite useful sister guide to small sex-topic periodicals, as well as organizations and vendors, is *The Black Book*, noted above. Large periodical directories may also list some of these publications. (End of update by M. Cornog and R. T. Francoeur)]

### [C. International Sexuality Description Project

ROBERT T. FRANCOEUR

[Update 2003: The editors of the four-volume *International Encyclopedia of Sexuality* (1997, 2000) and this 2003 in-depth report on 62 countries, the *Continuum Complete International Encyclopedia of Sexuality*, welcome the appearance of an important complementary project, the International Sexuality Description Project. The following summary is based on information supplied by David P. Schmitt.

[ISDP is an anonymous survey study designed to assess sexual attitudes and behaviors across a large number of cultures (Schmitt et al. 2003). Founded by David P. Schmitt of Bradley University in 2000, the ISDP includes a network of psychologists, biologists, sociologists, and other social scientists from 56 nations. In total, more than 100 research scholars took part in the ISDP and administered an anonymous sex survey to 100 men and 100 women, typically college students in their country. The ISDP survey was translated from English into 30 languages using a translation/back-translation procedure and was eventually administered to a total sample of over 17,000 people. The ISDP survey included measures of romantic attachment styles, global self-esteem, the "Big Five" personality traits, short-term mating desires, human mate-poaching behaviors, sociosexuality, and the "Sexy Seven" measure of human sexuality (Schmitt & Buss 2000).

[In its first report (Schmitt et al. 2003), ISDP addressed the hypothesis of evolutionary psychologists that men and women possess both long-term and short-term mating strategies, with men's short-term strategies differentially rooted in the desire for sexual variety. The ISDP survey results supported the existence of culturally universal sex differences in the desire for sexual variety.

[A second report focused "on adult romantic attachment, specifically gender differences in the 'dismissing' form of adult romantic attachment. Dismissing romantic attachment orientations are indicated by an avoidance of close personal relationship and the tendency to prevent romantic disappointment by maintaining a sense of relational independence and emotional distance." This article critically evaluates whether men are universally more dismissing than women (Schmitt & Buss 2003).

[A follow-up study, the ISDP-2, is currently underway and will include samples from more than 60 cultures. In this new study, they have included measures of impression management, sex-role ideology, sexual aggression, domestic violence, HIV/AIDS knowledge, and HIV/AIDS risk behavior. The founding director of the ISDP, David P. Schmitt, may be contacted at [dps@bradley.edu](mailto:dps@bradley.edu). (End of update by R. T. Francoeur)]

### D. Sexuality Education of Physicians and Clergy

#### *Medical School Sexuality Education*

RICHARD J. CROSS

Medical schools have always taught certain aspects of sexuality, e.g., the anatomy of the male and female sex organs, the menstrual cycle, basic obstetrics, and some psychology and psychiatry. That picture began to change about 30 years ago when Harold I. Lief (1963, 1965), a psychiatrist at Tulane University Medical School in Louisiana, wrote articles pointing out that most Americans regarded physicians as authorities on human sexuality, that the field of sexology was changing fast, and that only three medical schools in the country were even trying to teach modern sexology. The situation gradually improved, and when Harold Lief and Richard J. Cross, a physician who had introduced sexology education at the Robert Wood Johnson

Medical School at Rutgers University in New Jersey, sent a questionnaire to all medical schools in the U.S. and Canada in 1980, they found only three schools that said they did not teach sexuality. However, they did not publish their results because of the poor response rate and apparent unreliability of self-serving responses from medical school administrators. It was clear, however, that the improvement was limited; part of the change reported was because of different interpretations of the questionnaire and differing definitions of "sexuality." No one knows just what is being taught in the different medical schools today.

Part of the problem is that medical schools have traditionally defined education as the acquisition of factual information and certain skills by students. In the field of sexuality education, affective learning is also important. The greatest shortcoming of most practicing physicians is their discomfort. Since early childhood, they have been taught that sex is a private subject and that it is impolite and/or improper to talk about it. Physicians, who have not learned to confront and overcome their discomfort in talking about sex, transmit to their patients nonverbal, and sometimes verbal, messages that they do not want to hear about sexual problems. Their patients, who are often equally uncomfortable, cooperate by not raising any sexual issues. The result, too often, is "a conspiracy of silence," in which sexual issues that sometimes have a great impact on health never get discussed.

A number of medical schools have instituted courses or short programs in sexuality that emphasize attitudes, values, and feelings, rather than the memorization of factual information. These courses make extensive use of sexually explicit, educational films and videos and panels of people who are willing and able to talk about their personal sexual experiences. Following each large-group session, the students break into smaller groups who meet with facilitators to process what they have heard and seen with an emphasis on their personal feelings and reactions. Such programs seem to give medical students a better understanding of their own sexuality, a greater tolerance for unusual sexual attitudes they may encounter in their patients, and greater comfort in dealing with and discussing sexual issues.

Unfortunately, these programs rarely elicit enthusiastic support from the medical school faculties, who, after all, have been selected for their expertise in analyzing scientific data. Time is jealously guarded in the medical school curriculum. Money has always been a concern in higher education, but money gets tighter year-by-year, and small groups are expensive to organize and run. Many sexuality programs in medical schools are elective, which is sad, because the students who need these courses most are often the least likely to register for them.

Despite 30 years of improved sexuality education, most American doctors still do an inadequate job of helping patients with sexual problems. Comprehensive courses seem to help, but in the current conservative political and economic climate, it seems unlikely that they will be greatly expanded in the near future. In fact, there are indications that some programs are in danger of being cut back. There is, on the other hand, a small but growing move in the Association of American Medical Colleges to go beyond stuffing facts into students by dealing with attitudes and feelings in the medical school curricula. If this takes hold, sexuality courses may lead the way. Time alone will tell.

#### *Sexuality Education for Clergy in Theological Schools and Seminaries*

PATRICIA GOODSON and SARAH C. CONKLIN  
*History.* Protestantism has historically enjoyed the status of dominant religion in this country, but democracy, with its

emphasis on religious freedom and pluralism, has nourished the establishment of countless religious groups. Because these groups are numerous, and the education of their leadership varies considerably, a discussion of clergy training in sexuality requires qualification.

The main focus here will be on the seminaries and students included in the studies conducted by Conklin (1995) and Goodson (1996). Denominationally, the emphasis in these studies was mainly on Protestant and Roman Catholic clergy, although Jewish seminary faculty members were interviewed for the study by Conklin. By including both conservative and liberal schools and denominations, the largest religious groups are represented, but the samples are neither random nor the results generalizable.

Seminaries and theological schools are defined here as institutions of higher education accredited by the Association of Theological Schools (ATS). They offer post-baccalaureate degrees leading to ordination and licensure of pastors, priests, ministers, rabbis, chaplains, and pastoral counselors (categories broadly referred to as clergy).

Traditionally, clergy students have been characterized as young, white, and male, but this profile is slowly changing. First, it is becoming an older population composed of more part-time and second-career students. Second, diversity in both ethnicity and gender is increasing. In a comparison of motivations, women were more inclined to report entering seminary to discover "ways to best serve Christ in the church and the world" or "personal spiritual growth and faith development" rather than "preparing to be a parish minister," which was the overwhelmingly reported motivation for men entering seminary (Aleshire in Hunter 1990, 1265). In terms of sexuality education, seminary students are now perceived as being "more diverse in attitudes, more willing to share personal experiences, and more open about sexual orientation" than in previous generations (Conklin 1995, 231).

Conflict over whether seminary education accents professional training or personal formation may be a factor accounting for the apparent lack of emphasis on sexuality content (Kelsey 1993). As the percentage of female students has increased, greater awareness and sensitivity about the negative sexual experiences of women has been accompanied by curricular changes. As clinical settings for counseling practice have been included in most seminary curricula, less emphasis has been placed on foundational education (languages, such as Latin, Greek, and Hebrew, are less often required), but issues of training remain problematic, especially concerning sexuality education.

The scientific literature contains abundant evidence of the positive role that clergy may have in health promotion generally and in sexual health promotion, specifically. One study affirmed, for instance, that nearly half of all referrals made by clergy to mental-health professionals "involved marriage and family problems" (Weaver 1995, 133).

Recently, however, this supportive role has come into question as trust in clergy generally has been undermined by the misconduct of a few. Fortune (1991) contends that omission of sexuality components in professional training misses an intervention opportunity for clergy students to explore ethical boundary issues concerning what appropriate sexual conduct consists of prior to entering the profession. Such evidence clearly points to the appropriateness of marriage, family, and sexuality content in clergy training, but such content seems lacking or is limited by various internal and external restrictions.

*Prevalence.* When seminary course offerings were surveyed in the early 1980s, only a small number of courses included the term *sex* or *sexuality* in their title or description

(McCann-Winter 1983). It might be assumed that sexual content is included in courses not so named, but this low prevalence still indicates that sexuality content is not prevalent in most clergy training programs.

A review of literature on training in pastoral counseling cites one study in which 50 to 80% of the sampled clergy thought their training in pastoral counseling was inadequate and did not equip them to deal with marital counseling issues (Weaver 1995). A study by Allen and Cole (1975) comparing samples of Protestant seminary students in 1962 and 1971 found that the students in the more recent sample did not perceive themselves as better trained in family-planning issues than those students in 1962. A recent study by Goodson (1996) documented that 82% of the Protestant seminary students surveyed declared having had zero hours of training in family planning in their seminaries, and 66% expressed desire for more training on this topic.

When seminary faculty members who include some aspect of sexuality in their courses were interviewed (Conklin 1995), they indicated that they did not identify themselves as sexuality educators, and they expressed anxiety about how their teaching of sexuality content would be viewed by others. Yet, they expressed optimism and hope, because sexuality content and courses are sought and positively evaluated by students, even though not required. There is eagerness and enthusiasm by students, congregants, and clergy to have sexuality issues addressed openly and to move in the direction of health, justice, and wholeness.

*Content.* Profound changes have occurred in the past four decades regarding sexuality education in seminaries. Resources which were once viewed as advantageous are now seen as outdated. More use is being made of commercial films, literature, and case studies. Printed materials with sexuality content have vastly increased in both quantity and quality. The Sexual Attitude Reassessment (SAR) model, providing intense and condensed exposure to a range of explicit materials, panels, and speakers interspersed with small-group processing, is still viewed with both affirmation as effective and with suspicion as risky (Rosser et al. 1995).

Increased awareness of the pervasiveness of negative outcomes related to sexuality has provided the impetus for continuing-education requirements, mandatory screening of various sorts, development of training programs, trainers, centers, and professional counselors, therapists, and consultants focusing on prevention of various kinds of violations. An understanding of sexuality based upon the content of sexual relationships, rather than the form of sexual acts, is described as a paradigmatic change now underway.

In the Conklin study (1995), sexual orientation and related terms were included, either as central concerns or peripherally, in all but one of the 39 interviews with seminary faculty. Prevention of harm seemed a more common goal than promotion of sexual health, and resources, language, and experiences for classroom use which focus on positive aspects of sexuality seem to be lacking. Examples of content frequently mentioned in the interviews included sexual violence, such as rape, abuse, and incest, sexual harassment and misconduct, sexually transmitted diseases, and sexual compulsivity. Content having religious connections included ordination, celibacy, incarnation, sexual theology, and sacrament.

*Support and Resistance.* While the need for professional sexuality education within seminaries has been documented in a few studies, and Conklin's qualitative assessment has indicated strong faculty support for teaching sexuality content, some resistance is still expected. Limitations may arise from diverse sources, such as denominational executives

and curriculum committees, seminary reward and assignment systems for faculty, financial restrictions, and students' reluctance to deal with sexual issues or be in value conflict with their institution or instructor's teaching.

Goodson's survey (1996) of the attitudes of Protestant seminary students toward family planning identified 4.5% of conservative students, as compared to 0.9% of non-conservative students ( $p < .05$ ), espousing unfavorable views of family planning, and potentially opposing its teaching in seminary. With this same sample, when analyzing a statistical model to predict intention to promote family planning in their future careers, the variable "attitudes toward sexuality" emerged as a strong mediator of the relationship between the variables "religious beliefs" and "attitudes toward family planning." While "religious beliefs" exhibited a correlation of 0.81 with the "attitudes toward sexuality" variable, conservative students had, on average, more-negative views of sexuality when compared to their non-conservative counterparts. The difference was statistically large: 1.04 standard deviation units, and significant at the 0.001 level of probability.

*Resources and Intervention Needs.* Given these findings, it is clear that religious beliefs need to be considered when selecting resources and planning interventions. At present, it seems broad-based support for sexuality education comes from insurers encouraging risk-reduction measures to prevent actionable behaviors which could lead to claims or litigation. Some administrative encouragement of faculty efforts has been reported, especially in response to student pressure or suggestions from peers or superiors. However, this support seems to be far outweighed by administrative indifference or caution, although perceived hostility has decreased.

A high standard has been set by faculty members who have taught and written about sexuality. Impetus to do more, not less, seems dominant, especially among faculty. However, no one has clearly articulated as a unified plan of action what there should be more of in this area. There is, however, some openness toward planning and development rather than a rigid adherence to an already conceived plan or model. A current resource encouraging the development of plans or models is the Center for Sexuality and Religion in Wayne, Pennsylvania.

As we see it, a two-pronged approach to sexuality education is needed, in which promotion of assets and prevention of deficits are both necessary (Conklin 1995). Clearly, the main assets of Protestant and Catholic churches include their nurturing, caring, and supportive environments, as well as maintenance of centers for dissemination of knowledge and training of their leaders. Nevertheless, such training has been characterized as deficient, and the need to plan, implement, and evaluate appropriate sexuality programs is notorious. The outcomes of a successful two-pronged intervention, which balances emphasis on both sexual health and sexual harm, may be worth pursuing, if we consider the important role clergy and churches have had, and may continue to have, in promoting the health and well-being of people in this country.

[*Update 2003:* Reports of clergy sexual misconduct in the media have reinforced the belief that theological education must actively seek to professionally train male and female clergy and ministers to competently and responsibly care for and minister to the well-being of individuals (including their sexual health). In order to provide this preparation, theological schools may need to revise and implement curricula to address sexuality-training needs. The authors developed and administered an assessment of sexuality education currently offered in American seminaries and theological schools. The instrument included a measure of institutional

readiness to begin or share sexuality-related experiences (Conklin 2001). Surveys went to all 183 institutions in the U.S. accredited at the time by the Association of Theological Schools (ATS). Thirty-seven percent ( $N = 69$  schools) responded. Questions addressed both developmental and educational experiences contributing to formation (personal development) as well as professional academic preparation for leadership roles in ministry.

[Results varied from 85% reporting current curricular efforts in which the sexuality content is embedded, to 47% saying they offered courses in which the sexuality content "stands alone," to 12% citing previous noncurricular events (workshops, convocations, or spiritual direction) in which the sexuality content was embedded. When *all* questions were counted, those concerning noncurricular efforts and previously offered courses, as well as current curricular efforts, the frequency of responses was equally split between those who did offer sexuality-related courses, content, or experiences and those who did not. An implication to be drawn from this finding is that about the same number of schools report doing nothing regarding teaching of sexuality as report doing something. But one needs to remember that two thirds of the 183 seminaries did not respond. The content and duration of *what* the theological schools *are* doing still needs to be investigated. Also, the attitudes of clergy toward pastoral counseling, and their training regarding sexuality issues, are questions needing further research (Goodson 2002). Although many schools express willingness to implement and share sexuality-education efforts and some clergy report feeling competent to counsel regarding sexuality issues, much more needs to be done. (*End of update by S. C. Conklin & P. Goodson*)]

### [*Sexuality and American Popular Culture*

RAYMOND J. NOONAN

[*Update 2003:* Popular culture encompasses the cultural artifacts and practices of the masses. And it is through American popular culture that we have exported our sexual ideology to the world, which may, in part, have provided the fuel that energizes religious fundamentalist fanatics to commit terrorist acts (see discussion on Sexuality and Terrorism in the United States in Section 1, Basic Sexological Premises). Indeed, it is usually these images from American popular culture that most ordinary people think of when they think of Americans and who we are. It is typically young and brash, and it lives in the present with only fleeting recognition of the past or the future. It encompasses literature and the visual arts, theater and the cinema, and music. It also embraces fashion and the media. In the last 30 years, it has begun to have a history, which is continually being written, and, indeed, a philosophy.

[In that respect, it is much like the history of previous decades, in which Hollywood movies exported American culture to Europe and the rest of the world, similar to, although more efficiently than the rest of the world exported their cultural artifacts to the United States. Marshall McLuhan (1964) might have explained it as a natural extension of the impact of the new medium—motion pictures—that involved the viewer through the two most-immediate senses, sight and sound, more deeply than the written word. Of course, it occurred even much earlier, more slowly again and sporadic, this time over centuries or so, when the East and West met in the days when the great sailing ships opened new horizons. The influence on sexual practices in Japan, for example, can be seen in their erotic art of the 1800s, as these cultures began to show the influence of con-

tact with Western cultures, for better or worse (Kronhausen & Kronhausen 1970ab).

[Thus, much of popular culture is enabled by technology. It has been noted that almost every technological innovation is soon used for sexual expression (Noonan 1998c). It was true of Gutenberg's printing press in the 1400s and the camera in the 1800s. It was true more recently of the videocassette recorder (VCR) and video camera, and later, cable television; and it is true today of the DVD and the Internet and World Wide Web. All facilitated the sharing of sexual ideologies and experiences.

[As a result, we had a rich erotic literature develop that was rather cheaply and easily disseminated, both into and out of the country, extending the erotic "writing of harlots" that has evolved little through the ages. After all, there are only a finite (though extensive) number of ways our anatomy can fit together that is satisfying for most people. The banned writings of D. H. Lawrence, Henry Miller, and many others are just part of a long tradition that has largely become assimilated into everyday literature, film, and television. Advertising especially capitalizes on the erotic impulse to sell practically anything. Thus, the groundbreaking work of Lawrence and others of the genre have entered a baroque period, where the art is refined, but not much of it is cutting-edge or often even exemplary. Much of it is stylized and predictable, and, when it is good, it touches a chord in many readers or viewers as "real." That is often the demarcation between gratuitous sex in the media and pornography, on the one hand, and sex that could be a part of one's ordinary life—that is part of one's own storyline, good or bad, on the other.

[Thus, the following sections highlight several contemporary topics that are continuing to have a profound impact on American sexual culture in our everyday lives. The first is the ubiquitous Internet, originated by the U.S. Defense Advanced Research Projects Agency (DARPA) and driven by Cold-War fears of nuclear war that eventually became a means of communication for scientists. It was finally released for commercial use in the mid-1990s, at which time development advanced rapidly, often driven by sex-related entrepreneurs, especially those seeking the best and most-profitable ways of delivering explicit sexual images to a vast, worldwide market (see Noonan 1998c). The first article appeared in volume 3 of the first edition of the *International Encyclopedia of Sexuality*, when the Internet boom was still new. The second article updates that one, and focuses on contemporary online sexual activities and the diverse uses that sexologists and the general public have made of the medium as its sophistication and use have spread in the intervening years. In addition, it looks at some of the problems, such as compulsive Internet sexual behaviors, and their implications for sex-related therapies.

[The third article looks at the cutting-edge on the literary front: gay and lesbian literature. It might be said that this genre is at the stage that sexually oriented literature depicting the diverse lifestyles of heterosexuals was decades ago, when society broke the bonds of postal regulations and other laws prohibiting the sale and distribution of authors who have since become classics in erotica, if not American and English literature. As noted above, such depictions have become commonplace in literature, film, and television, with little extraordinarily novel. Gay and lesbian literature, on the other hand, being relatively recently released from similar, if not somewhat greater prohibitions, is poised to break new ground and to produce future classics. Indeed, new courses in gay and lesbian literature are being written and offered more frequently in colleges across the nation.

[The fourth article delves into sexually explicit lyrics in popular music, offering a look at the historical antecedents,

often hidden, that have been a part of the folk and even classical tradition for at least two centuries. Thus, critics, whose contemporary uproar in the United States over sexually explicit words and concepts in rap and hip-hop and other popular genres continues to make headlines, need look back no further than Cole Porter and the psychedelic music of the 1960s for sexual content in the musical lyrics of our nearest previous generations.

[The final article takes a sociological look at fashion in America and the reciprocal influence that it has on a generation's sexuality and how their sexuality, in turn, along with current events, influences the fashions of the day. It, too, looks at the historical antecedents of how contemporary fashion, widely recognized by sexologists as accentuating the secondary sex characteristics of both males and females to make them more attractive to potential friends, lovers, or spouses, has changed through the ages. Thus, fashion reflects the images of attractiveness that define each generation and its social context within then-current definitions of gender and the place of each in the social hierarchy and the cultural sphere. (End of update by R. J. Noonan)]

### A Door to the Future: Sexuality on the Information Superhighway

*Sexuality and the Internet* SANDRA BARGAINNIER

People interested in sexual topics have always been quick to explore a new mode of communication—from graffiti on a prehistoric cave wall, movable type, photography, and radio, to video cameras, VCRs, and videocassette rentals and sales—as a way around the censorship society uses to regulate and limit the dissemination of sexual information. The most recent new mode of communication, the computer-based "information superhighway," the Internet or simply "the Net," is no exception. From its birth, the Net has raised images of erotica, pornography, and cybersex available in the privacy of one's home. The Net does provide sexuality information for the general "online" public, but it can also provide a wealth of reliable information for sex researchers, sex educators, and sex therapists. However, the use of the Net to access sexuality information has also brought the inevitable sequel of society's effort to regulate this new avenue of sex information.

The Internet is not a physical or tangible entity, but rather a giant network which interconnects innumerable smaller groups of linked computer networks. In early 1995, the global network of the Internet had 2 million Internet hosts; in late 1995-1996, 5 million hosts; and in early 1996, 9.5 million hosts. This is expected to double to 20 million hosts sometime in 1997. However, the number of Internet hosts is misleading, because many hosts limit access of their users with firewalls and other electronic barriers.

Gateways to a variety of electronic messaging services allow Internet users to communicate with over 15 million educational, commercial, government, military, and other types of users throughout the worldwide matrix of computer networks that exchange mail or news. These rapidly developing, and constantly changing, network information and retrieval tools are transforming the way people learn, interact, and relate. These networks provide users with easy access to documents, sounds, images, and other file-system data; library catalog and user-directory data; weather, geography, and physical-science data; and other types of information (Schwartz & Quarterman 1993). Professional journals, papers, conferences, courses, and dialogues are increasingly delivered electronically.

Although the federal government initiated the Internet during the "Cold War" as a way to send top-secret information quickly and securely, no government or group controls

or is in charge of the Internet today. The Internet depends on the continuing cooperation of all the interconnected networks (Butler 1994). Because there is no proprietary control, anyone can send email (electronic mail), start a newsgroup, develop a listserv, download files, and/or have their own World Wide Web (WWW) home page or Web site. This freedom has opened the cyberspace doors to the sexuality arena.

For sexuality professionals, the opportunities in cyberspace are limitless. Email is just one of many functions. This one-on-one mode of electronic communication allows colleagues to communicate and collaborate in their research worldwide, pursue new leads quickly, test new ideas and hypotheses immediately, and build networks of like-minded colleagues. Whole documents can be attached to email, sent electronically around the globe, and downloaded by the recipients almost instantly. Both time and money can be saved by editing online and bypassing postal delays and costs.

Many American university professors communicate with their students by email. Lessons, syllabi, and homework are passed back and forth with email. Email can also provide the shy or quiet students in a class another venue for participation.

Listserv mailing lists are similar to email, but instead of communicating with only one other person, communication takes place among many. Many Americans of all ages subscribe to a mailing list and use it as a good place to debate issues, share professional ideas, and try out new concepts with others. Subscribers automatically receive correspondence from others who belong to the list. It is like reading everyone's email about a particular topic. Hundreds of listservs exist, including those that address rape, gay and bisexual issues, feminist theory, women's health, AIDS, addictions, survivors of incest, and advocacy, to name a few.

In addition to sending email to individuals or to a mailing list, Americans are increasingly meeting people and sharing interests through newsgroups. Like listservs, newsgroups are open discussions and exchanges on particular topics. Users, however, need not subscribe to the discussion mailing list in advance, but can instead access the database at any time (Butler 1994). One must access a special program called a newsreader to retrieve messages/discussions from a newsgroup. A local site may have many newsgroups or a few.

Newsgroups are as diverse as the individuals posting on them. Usenet newsgroups are arranged in a hierarchical order, with their names describing their area of interest. The major hierarchies are talk, alt, biz, soc, news, rec, sci, comp, and misc. Some examples of newsgroups in the field of sexuality are: sci.med.aids, talk.abortion, soc.women, soc.men, soc.bi, alt.sex, alt.transgendered, alt.sexual.abuse.recovery, and alt.politics.homosexuality. This hierarchy and system of naming help the user decide which groups may be of interest.

Many groups provide informative discussions and support. Other groups are often magnets for "flamers" (those who insult) or people posing as someone else (i.e., a young adult male posing online as a lesbian). One benefit of the newsgroup is that anyone can read the articles/discussions but not participate. These voyeurs are called "lurkers." This may be a safe starting point for a few months until one has an understanding of the group, their history, and past discussions. "Newbies" (newcomers to groups) are often flamed if they ask neophyte questions in some newsgroups. Reading a newsgroup's "FAQ" (frequently asked questions) page prior to inquiring online is one way newbies can avoid being flamed for naive or inappropriate inquiries.

In addition to transmitting messages that can be read or accessed later, Internet users can also engage in an immediate dialogue (called "chat") in "real time" with other users. Real-time communication allows one-to-one communica-

tion, and "Internet Relay Chat" (IRC) allows two or more people to type messages to each other that almost immediately appear on the other's computer screen. IRC is analogous to a telephone party line. In addition, most commercial online services have their own chat systems allowing members to converse. An example of a chat system is the Human Sexuality Forum on CompuServe, a proprietary online network that also offers members access to the Internet.

In addition to email, newsgroups, listservs, and chats, one can access information by transferring files from one computer to another with FTP (file transfer protocol). One important aspect of FTP is that it allows files to be transferred between computers of completely dissimilar types. It also provides public file sharing (*The Internet Unleashed*, 1994). These files may contain text, pictures, sound, or computer programs.

Another method of connecting with remote locations is through Telnet. Telnet allows the user to "log in" on a remote machine in real time. For example, a student can use Telnet to connect to a remote library to access the library's online card catalog.

American sexuality professionals now communicate, collaborate, and discuss issues with colleagues around the globe. They can also access information from around the world. Two of the more common methods for accessing information are Gopher and the World Wide Web (WWW). A user can collect data, read conference proceedings, tap into libraries, and even search for jobs online.

Gopher guides an individual's search through the resources available on a remote computer. It is menu driven and easy to use. Most American colleges and universities have a local Gopher menu. Gopher can also be accessed through most commercial online services. Gopher allows users to access information from various locations. The National Institute for Health, the Centers for Disease Control and Prevention, and the National Library of Medicine are just a few examples of sites that are accessible via Gopher.

Most information sites that can be reached through Gopher can also be accessed via the World Wide Web. The "Web" uses a "hypertext" formatting language called hypertext markup language (HTML). Programs called Web browsers that "browse" the Web can display HTML documents containing text, images, sound, animation, and moving video. Any HTML document can include links to other types of information or resources. These hypertext links allow information to be accessed and organized in very flexible ways, and allow people to locate and efficiently view related information, even if the information is stored on numerous computers all around the world.

Many organizations now have "home pages" on the Web. The homepage typically serves as a table of contents for the site, and provides links to other similar sites. Some websites that may be of interest to the sexuality professional are: the Society for the Scientific Study of Sexuality (SSSS) [<http://www.sexscience.org/>]; the Kinsey Institute [<http://www.kinseyinstitute.org/>]; the Sexuality Information and Education Council of the United States (SIECUS) [<http://www.siecus.org/>]; the Queer Resources Directory [<http://www.qrd.org/qrd/>]; and Tstar [<http://travesti.geophys.mcgill.ca/~tstar/>]. TStar provides resources and information for the transgendered community. The TStar home page is also a gateway to other resources on the Web, such as the Lesbian, Gay, Transgendered Alliance, and the Gay, Bi-Sexual, Lesbian, and Transgender Information from the United Kingdom. [Editors' Note: *The SexQuest Web Index for Sexual Health* provides links to many of the best sexuality research, education, and therapy sites on the Web: <http://www.SexQuest.com/SexQuest.html>.]

Sex researchers, educators, and therapists can use email, listservs, newsgroups, and the World Wide Web for updated information and resources. Sexuality professionals can also use the Internet as a new frontier for sex research. Approximately 200 active Usenet newsgroups deal with sex and variations of some sexual theme (Tamosaitis 1995). Very few have researched who these newsgroup users are, what sexuality knowledge they possess, what sexual attitudes they hold, or in which types of behavior they engage.

In the fall of 1994, a modified version of the Kinsey Institute Sex Knowledge Test was distributed to 4,000 users online (Tamosaitis 1995). The results showed that over 83% were male, white, highly educated, single, middle- to upper-class, and not afraid of technology. The majority were in their 20s and 30s and predominantly bicoastal, with 63% living either on the West or East coasts. The survey demonstrated that both the sexually oriented and general online user group respondents are more knowledgeable about women's sexuality issues than they are about comparable men's issues when compared to the general offline population polled (Tamosaitis 1995). This study, the first of its kind, could provide the impetus for further online research. Of the 20 most popular Usenet newsgroup forums, half are on sex-related topics (Lewis 1995).

Several universities are also concerned about sexually explicit material and are limiting or prohibiting access to certain newsgroups. In November 1994, Carnegie Mellon University moved to eliminate all sexually oriented Usenet newsgroups from its computers. Stanford, Penn State, Iowa State and other universities have also attempted to limit access (Tamosaitis 1995).

### *Legal Challenges to Free Speech on the Internet*

BARBARA GARRIS

Politically, any mention of sexuality in international cyberspace, from the most benign to the most perverse, is currently under scrutiny in the Supreme Court. In June 1995, Senator James Exon offered the Communications Decency Act of 1995 as an amendment to the Telecommunications Act of 1996, which was then included in the Telecom Act as Title 5, Section 507. The Communications Decency Act (CDA) expands regulations on obscene and indecent material to minors which would be transmitted to them through the telephone lines by way of the worldwide Internet, or any other online service (Italiano 1996; Lewis 1995; Lohn 1996).

The bill included, in a very subtle unthreatening way, elements of the old Comstock Act of 1873, which, in the past, made it a crime to send material on birth control and abortion through the postal service (Schwartz 1996a). This archaic act, inserted by Representative Henry J. Hyde, a longtime abortion foe, remains on the legislative books today as 18 U.S.C. Sec. 1462. Elements of the Comstock Act prohibiting dissemination of contraceptive information and the sale of contraceptives to married and single women had been declared unconstitutional in various decisions, the last two in 1966 and 1972. However, the prohibition against providing information about abortion remains on the books to the present. In the new Communications Decency Act, the maximum fine for providing information about abortion has been raised from \$5,000 to \$250,000 for anyone convicted of knowingly transmitting any "obscene, lewd, lascivious, filthy, or indecent" communications on the nation's telecommunications networks including the Internet. Meanwhile, other legislators sponsored legislation, the Comstock Clean-up Act of 1996, to repeal completely the remnants of the Comstock Act.

The Telecommunications Act of 1996 was signed by President Clinton on February 8, 1996. Although the Presi-

dent signed the bill into law, he immediately issued a disclaimer, saying that

I do object to the provision in the Act concerning the transmission of abortion related speech and information. . . . The Department of Justice has advised me of its longstanding policy that this and related abortion provisions in current law are unconstitutional and will not be enforced because they violate the First Amendment [protecting freedom of speech].

The CDA was included in the Telecommunications Act supposedly to squelch online pornography and make the World Wide Web and the Internet, as well as other online services, "safe" for children. But the wording crafted by Internet-illiterate congressmen was so vague and overly broad that even the most innocent use of health-related information could result in a \$250,000 fine and two years in prison. Free-speech activists, spearheaded by the American Civil Liberties Union, Electronic Freedom Foundation, American Library Association, and many others, were appalled and filed suit to keep at bay any prosecution and punishment for this alleged online crime until the case can be heard by the United States Supreme Court.

Suit was immediately filed by the American Library Association and the Citizen's Internet Empowerment Coalition in the United States District Court for the Eastern District of Pennsylvania seeking a preliminary injunction against the CDA on the constitutional grounds of the right to free speech. "Plaintiffs include various organizations and individuals who, inter alia, are associated with the computer and/or communications industries, or who publish or post materials on the Internet, or belong to various citizen groups." The case was heard before Judge Sloviter, Chief Judge, United States Court of Appeals for the Third Circuit, and Judges Buckwalter and Dalzell, Judges for the Eastern District of Pennsylvania.

An injunction was granted on June 11, 1996, after all three judges had schooled themselves with hands-on experience with the Internet. The basis for the injunction was threefold:

1. That whatever previous decisions had been handed down limiting indecent expression on other media (such as cable television and radio) could not be applied to cyberspace,
2. Control over pornography aimed at children rested with the parents and schools, not with the government nor with online services transmitting the offensive material, and
3. There was no technological way available to the Internet of checking the age of Internet users, except the use of credit card numbers, to access hardcore pornography.

All three judges saw the CDA as patently unconstitutional and asked the Supreme Court for a final ruling (EPIC 1996; McCullough 1996; *The New York Times* 1996; Quinttner 1996; Schwartz 1996b).

On July 1, 1996, the U.S. Department of Justice officially filed an appeal. In its September 30, 1996, edition, *HotWired* magazine reported that the U.S. Department of Justice was stalling for time, and the U.S. Supreme Court granted them an extra month to submit filings. The case was supposed to have been heard in the Supreme Court in October 1996, but no new hearing date had been published as of November 1996. As of March 1997, the CDA was going to the Supreme Court, with a decision expected in June.

Judge Dalzell's opinion sums up the ongoing debate over sex on the Internet:

True it is that many find some of the speech on the Internet to be offensive, and amid the din of cyberspace many hear discordant voices that they regard as indecent. The absence of governmental regulation of Internet content has unquestionably produced a kind of chaos, but as one of plaintiffs' experts put it with such resonance at the hearing: "What achieved success was the very chaos that the Internet is. The strength of the Internet is that chaos."

Just as the strength of the Internet is chaos, so the strength of our liberty depends upon the chaos and cacophony of the unfettered speech the First Amendment protects.

For these reasons, I without hesitation hold that the CDA is unconstitutional on its face.

Since the filing of this case, three other state cases have been brought to court. A New York City case, filed April 30, 1996, by Joe Shea, a reporter for the *American Reporter*, sought to overturn the CDA, claiming that the law limits freedom of speech for the press. On July 29, 1996, the court ruled in favor of Shea. This case is expected to be folded into the primary case brought to the Supreme Court by the American Civil Liberties Union (ACLU) et al. suit mentioned above. At the same time, journalism professor Bill Loving of the University of Oklahoma filed suit against the university charging that it blocked access on April 1, 1996, to a newsgroup, "alt.sex," after the university received complaints from a fundamentalist religious organization. Loving claimed that restricting students' access to the Internet is a violation of their First Amendment rights. (As of late 1996, he was awaiting the University's response.) Finally, effective July 1, 1996, the Georgia State General Assembly passed a law providing criminal sanctions against anyone falsely identifying themselves on the Internet. A suit (*ACLU of Georgia et al. vs. Miller et al.*), seeking a preliminary injunction against the Georgia statue, was filed September 24, 1996, by the ACLU, Electronic Frontiers Georgia, Georgia State Representative Mitchell Kaye, and others. As of late 1996, the hearing had not been held.

#### *Summing Up* SANDRA BARGAINNIER

What is considered sexually explicit? Are safe-sex guidelines considered sexually explicit? Obviously, this type of law could disband the educational and informative sex-related Internet resources and the sex-related newsgroups.

Another concern associated with the Internet is the loss of community in the real world and the formation of online communities. Opponents believe that people are not honest about who they are in cyberspace, which is a fantasy land. Proponents say that virtual communities provide a place for support, information, and understanding. Many feel that gender, race, age, orientation, and physical appearance are not apparent in cyberspace unless a person wants to make such characteristics public. People with physical disabilities or less-than-glamorous appearances find that virtual communities treat them as they always wanted to be treated—as thinkers and transmitters of ideas and feelings, not just an able body or a face (Rheingold 1995). Many young people can be part of a community for the first time in their life by interacting with an online community. An online community might, for example, provide a teenage lesbian who feels alienated at school and home with a sense of self-worth and understanding.

Not since the invention of television has a technology changed how a nation and a world spend their time, gather information, and communicate, as has the Internet. Sexuality professionals and the public have the capacity to access tremendous amounts of sexual information, some of it valid and educational, some of it entertaining, and some that oth-

ers might label "obscene." But who is to judge? Sexuality professionals need to get involved before others judge what is deemed acceptable sexuality information. The Internet will also serve as a new frontier for sex research, sex education, sex information, collaboration, and communication (Tamosaitis 1995).

#### **Online Sexual Activity**

AL COOPER and ERIC GRIFFIN-SHELLEY

[*Update 2003*: The Internet is a key element in the Information Age in the United States, as well as worldwide, in which "rapid and far reaching technological advances are revolutionizing the ways in which people relate, communicate, and live their daily lives" (Jerome, DeLeone, Folen, Earles, & Gedney 2000). Sexuality is an integral part of these phenomena such that Online Sexual Activity (OSA) has been dubbed the "next sexual revolution" (Cooper & Griffin-Shelley 2002).

[The search engine *Google* now examines over three billion Web pages (Google 2003), up from one billion less than three years ago (Inktomi 2000). Sex is the most searched-for topic on the Net (CIOL 2001). The 172 million Americans online represent over half of the U.S. population (Nielsen NetRatings 2003), and worldwide there are 605 million Net users (Nua 2003). Twenty to 33% of people use the Net for online sexual activity (Cooper, Delmonico, & Burg 2000; Egan 2000).

[As with any human activity, Internet use has advantages, e.g., opening a previously inaccessible market, and disadvantages, e.g., identity theft. It stands to reason, then, that the same is true for Internet activities involving sexuality (Cooper, Scherer, Boies & Gordon 1999; Barak & King 2000). This chapter will provide a brief overview of these important and evolving issues. The speed of this revolution, and the intensity of its impact, are because of the "Triple A Engine" of accessibility (anytime, anywhere), affordability (a quick and easy local phone call), and anonymity (the perception that your identity is hidden) (Cooper, Scherer, Boies, & Gordon 1999). In addition, Internet activity can have a "disinhibiting" effect (Suler 2001), i.e., allowing people to engage in sexual activities that they might not otherwise have done. A geometrically expanding literature (Griffin-Shelley 2003) and research base (Noonan 2001) substantiate the power of this revolution.

#### *Definitions*

[For research and clinical work to proceed with a scientific foundation, one of the first steps is the development of a common agreed-upon nosology. Cooper and Griffin-Shelley (2002) have proposed this set of definitions:

[*Online Sexual Activity* (OSA) is defined as use of the Internet for any activity (including text, audio, and graphic files) that involves sexuality, whether for purposes of recreation, entertainment, exploration, support, education, commerce, efforts to attain and secure sexual or romantic partners, and so on.

[*Cybersex* is a subcategory of OSA, and can be defined as using the medium of the Internet to engage in sexually gratifying activities, such as, looking at pictures, engaging in sexual chat, exchanging explicit sexual images or emails, "cybering" (i.e., sharing fantasies over the Internet which involve being sexual together while one or both people masturbate), and so on.

[*Online Sexual Problems* (OSP) includes the full range of difficulties that people can have because of engaging in OSA. Such difficulties include negative financial, legal, occupational, relational, and/or personal repercussions from OSA. The "problem" may range from a single incident to a

pattern of excessive involvement. The consequences may involve feelings of guilt, loss of a job/relationship, STDs, and so on.

[Finally, *Online Sexual Compulsivity* (OSC) is a subtype of OSP and refers to excessive OSA behaviors that interfere with the work, social, and/or recreational dimensions of the person's life. In addition, there are indications of a "loss of control" of the ability to regulate the activity and/or to minimize adverse consequences (Cooper 1998; Cooper 2000; Griffiths 2001; Delmonico, Griffin, & Carnes 2002).

### *[Sexual Education and Information*

[Clearly, anonymously accessible and affordable information on human sexuality available worldwide at any time is a sex educator's dream. These dreams are becoming reality through the efforts of professional organizations such as the American Association of Sex Educators, Counselors, and Therapists ([www.aasect.org](http://www.aasect.org)) and businesses such as [www.bettersex.com](http://www.bettersex.com) or [www.sex-centre.com](http://www.sex-centre.com) (Bay-Cheng 2001). As with any health topic, the quality of information varies widely from the most empirically based and up-to-date to the most biased and misinformed, so consumers need to proceed with caution having a "buyer beware" attitude (Barak & Fisher 2001).

[People appear more comfortable obtaining information on sexuality via the Internet because of the "Triple A" and the accompanying capacity to reduce shame and inhibition (Millner & Kiser 2002). Online "sexperts" offer news, answers to frequently asked questions (FAQs) (Ochs & Binik 2000), education, e.g., the "Sexploration" columns of [www.MSNBC.com](http://www.MSNBC.com), and individual consultation. Sexual education efforts are international in scope, e.g., Lunin, Karizanskaya, Melikhova, Light, & Brandt-Sorheim (1997) report on efforts in Russia. Although beyond the scope of this article, online therapy for relationships and sexual issues is expanding, although many legal, ethical, and professional concerns remain to be resolved.

[Research on the reasons people engage in online sexual activity is in the early stages (Cooper, Scherer, Boies, & Gordon 1999; Cooper, Griffin-Shelley, Delmonico, & Mathy 2001). Cooper, Scherer, Boies, and Gordon (1999) found that for the 9,265 respondents in their study, most used adult websites, sex chat, and other sexual activities as "casual recreation"; 91.7% spent less than 11 hours per week on online sexual activity and 46.6% spent less than 1 hour per week. Eighty-four percent of men and 80% of women were satisfied with their online sexual activity, and 87% reported never feeling guilt or ashamed. Most people (81.6%) of the second large scale study ( $n = 7,037$ ) indicated that their online sexual activity served as a "distraction." Just under a third used online sexual activity for education (31.7%) and to cope with stress (29.9%) (Cooper, Griffin-Shelley, Delmonico, & Mathy 2001). Other reasons for online sexual activity included meeting people online for face-to-face (f2f) dating, socializing, engaging in sexual activities that the person would not do in real time, getting support for sexual concerns, and purchasing sexual materials.

[Gender has appeared to be an important variable in the early research in terms of Internet sexuality (Cooper, Scherer, Bois, & Gordon 1999; Cooper, Delmonico, & Burg 2000; Goodson, McCormick, & Evans 2001; Leiblum & Doring 2002). Women tend to be less involved in online sexual activity and prefer interactive media, i.e., chat rooms to more-voyeuristic activities like viewing pictures. Of note, recent research in Sweden (Cooper, Månsson, Daneback, Tikkanen, & Ross 2003) indicated that more-sophisticated research designs might significantly increase the percentage of women who participate in this type of research. Leiblum

and Doring (2002) and Podlas (2000) suggest cyberspace may be the leading edge of a continuing frontier for women's sexual liberation.

### *[Sexually Disenfranchised and Alternative Communities*

[Lesbian, gay, bisexual, and transgendered youth have appeared to suffer delayed development because of the intense hatred, discrimination, shame, and humiliation that the dominant culture expresses towards them. For example, most put off "coming out," and even their own understanding and acceptance, until they leave home for college or the city where there is more freedom, acceptance, and respect for their orientation. The Internet is changing that by giving sexually disenfranchised adolescents information, role models, peers, and opportunities for interaction unheard of even at the end of the 20th century (Burke 2000; Ross & Kauth 2002). These teens and other sexual minorities no longer have to live in shame, fear, and isolation (McKenna 2001). They can learn the "how tos" of sex through informative websites, pictures, and videos. They can connect with other people like themselves in online discussion groups, email lists, chat rooms, and instant messaging (Plymire & Forman 2000; Ross & Kauth 2002). They can find people and places to "hook up" to explore their sexual preference without having to go to bars, bathhouses, or bathrooms, or other clandestine rendezvous spots.

[Men who have sex with men are finding new vistas on the Net, but not without risks such as transmission of STDs (Bull, McFarlane, & Reitmeijer, 2001; Benetsch, Kalichman, & Cage, 2001; Elford, Bolding, & Sherr, 2001; Ross, & Kauth, 2002). At the same time, the Internet may offer new ways to prevent problems related to sexual activity (Bull & McFarlane, 2000; Bull, McFarlane, & King, 2001; Hospers, Harternick, Van Den Hoek, & Veenstra, 2002;). The Net can also be a vehicle for support and health information for those already suffering from STDs and HIV/AIDS (Reeves, 2001; Kalichman, Benetsch, Weinhardt, Austin, & Luke, 2002; Kalichman, Weinhardt, Benetsch, DiFonzo, Luke & Austin, 2002).

[Of course, the broadening of opportunities and freedom are not limited to sexual minorities. Any person or group may find love and sexual expression via the Net. Those who feel they are unattractive can establish relationships based more on their communication skills than their physical appearance. Support and connections have created the possibility of alternative cyber communities for sexual minorities and those with disabilities (Pendergass, Nosek, & Holcomb 2001; Tepper & Owens 2002). Elderly people who want to continue to be emotionally and sexually active are making connections and finding new vistas open to them from all over the world.

[People with atypical sexual interests and illegal preoccupations can find new arenas via the Net (Galbreath, Berlin, & Sawyer 2002; Kim & Bailey 1997). People, particularly men, are experimenting with a seemingly endless series of sexual variations, from voyeuristic interests (including pictures and video files from "spy cams") to exhibitionistic sites where those with their own "webcams" offer free or paid glimpses into their lives (Waskul 2002). The dominant/submissive lifestyle and sadomasochism are well represented and often link online and face-to-face ("f2f") experiences for those seeking them (Palandri & Green 2000). People with fetishes, from bestiality to trampling and even pedophilia (Durkin & Bryant 1999), are there for those looking for community (Galbreath, Berlin, & Sawyer 2002). Despite preliminary research indicating that much of this activity is beneficial, or at least benign, there is enough

that is not (Cooper, Galbreath, Becker, & Griffin-Shelley 2003) that policymakers and legislators, as well as the general public, have expressed concern and inquired about how to control and regulate this global phenomena.

### [Online Relationships]

[The impact of the Net on courtship and sexual relationships is only beginning to be the subject of empirical studies despite the increasing numbers of people who are using it for these purposes (Cooper, Scherer, & Marcus 2002). Success stories and disasters are regularly heard on the news, in consultation rooms, and, of course, across the Internet. Clearly, opportunities for meeting romantic and sexual partners have increased because of the Net, and online dating services, such as match.com and eharmony, are experiencing rapid growth and increased acceptance (Levine 2000). Proximity, physical appearance, and similarity do not play the role they do in face-to-face encounters (Cooper & Sportolari 1997), and the disinhibiting effect of Internet communication (Suler 2001) may lead to quicker and deeper connections between people.

[One of the early problems reported by clinicians was "Internet infidelity" (Shaw 1997; Young, Griffin-Shelley, Cooper, O'Mara, & Buchanan 2000). Some assert that the lack of actual contact negated the reality of the "affair," while others point out that partners reported that the feelings of violation and betrayal were similar to what they experienced when the infidelity involved face-to-face sexual contact (Schneider 2002).

[It may be possible to deceive and defraud people more easily in cyberspace than in real time. Stories abound of people who have found their "true love" online (Seiden 2001), as well as accounts of people discovering that the person they were connecting to lied about their gender, age, appearance, or life circumstances (Cornwell & Lundgren 2001). As the research about what makes for a good long-term relationship (Gottman 1994) becomes clearer and the instruments to measure those traits become more robust, this powerful medium may ultimately be proven to be better at helping a person to choose a life-mate than doing it "the old fashioned way," i.e., without the benefit of computer-assisted technology. At the same time, because of the increased likelihood of fantasy and projection being a larger part of online relationships, users will need to be cautious and aware that there may be a greater chance of reenacting traumatic and unsuccessful relationships in this venue (Schwartz & Southern 2000). Younger people who have "grown up with the Net" will find it an increasingly integral part of their romantic and sexual lives (Cooper, Månsson, Daneback, Tikkanen, & Ross 2003). Finally, as people become more sophisticated about life in cyberspace and online relationships, and more of the "facts" are known and disseminated, the chances will increase that more good and less harm will be the result.

### [Online Sexual Problems/Online Sexual Compulsivity]

[While the majority of online sexual activity has not led to problems, it does for some (Griffiths 2000; Putnam 2000; Stein, Black, Shapira, & Spitzer 2001). Research suggests that as many as a quarter of male Internet users indicate some level of difficulty associated with online sexual activity. Cooper, Scherer, Bois, and Gordon (1999) and Cooper, Griffin-Shelley, Delmonico, and Mathy (2001) indicated that 8% of users report Online Sexual Problems (OSP). Cooper, Delmonico, and Burg (2000) identified 1% of their sample as having Online Sexual Compulsivity (OSC). In addition, this research supports what clinical practice reports, i.e., that some people (perhaps 15%) are "at risk" for online

sexual problems, even when they do not have a prior history of acting out sexually (Cooper, Delmonico, & Burg 2000).

[Young people are not the only populations that can blossom or suffer as a result of their online romantic and sexual activity. Shy, lonely, and vulnerable adults (separated, divorced, or isolated), as well as those in a host of other "minority" categories (including the disabled or mentally ill) can find both happiness and harm via the Internet. Most adults are naïve about, or unaware of, the specific vulnerabilities of this medium, and are susceptible to victimization online via deception, romantic role-play, fraud, and exploitation.

[There are also secondary victims of people who have online sexual problems, i.e., people who suffer consequences because of the OSP person's Internet activities (Schneider 2000; Schneider 2002). For example, a wife and her children were left to survive on their own when their husband/father was caught in a police sting of people exchanging child pornography. Likewise, the congregation in a local synagogue was abandoned when their rabbi was abruptly fired after repeated incidents with online sexual activity.

[The implications for clinical practice include requiring expanded knowledge of behavioral problems that are new (e.g., cyber-affairs), expansions of existing disorders (e.g., cyber exhibitionism), and additional unhealthy opportunities for those with longstanding problems (e.g., pedophilia online) (Cooper & McLoughlin 2001). Some clinicians see the need for providing online education and/or counseling around sexual issues (Newman 1997; Graugaard & Winter 1998), as well as simply encouraging clients to use the Net as a resource and support network (Putnam 2000; Kalichman, Benotsch, Weinhardt, Austin, & Luke 2002). Noonan (1998c) has suggested terminology, *self-defined lovemap-inappropriate sexual arousal* (SDLISA), to describe the kinds of unexpected responses that some individuals may have from viewing gay or pedophilic (or other paraphilic) images that are not congruent with their identified lovemap. Such responses might be more significant today because of the ease with which such images might be encountered on the Internet, either by accident or curiosity or otherwise, and should be investigated.

[Treatment for online sexual problems and online sexual compulsivity is usually multi-modal, including individual, group, and couples therapies, as well as encouragement to obtain a medication evaluation when appropriate (Cooper & Marcus 2003; Orzack & Ross 2000; Putnam & Maheu 2000; Schneider and Weiss 2001; Delmonico, Griffin, & Carnes 2002; Griffin, Moriarty, & Delmonico 2001).

### [Children, Adolescents, College Students, and Young Adults]

[Children and adolescents are growing up with the Internet as part of their lives (Longo, Brown, & Orcutt 2002). From school research projects to chatting with friends, young people in America are increasingly familiar with the Internet's power for self-help and self-harm. As with other groups, the Net opens up unheard-of opportunities, e.g., friends around the world, and terrifying dangers, i.e., pedophiles posing as peers. Parents, teachers, legislators, and police are struggling to keep up and encourage healthy online activity while protecting this obviously vulnerable population (Finkelhor, Mitchell, & Wolak 2000). Nevertheless, Noonan (1998c) has noted how the notion of sexual predators online has been greatly exaggerated, particularly in comparison to the much greater risk of harm documented in many offline contexts, e.g., risk of intra-family sexual abuse.

[Children, obviously, need more help and supervision than teenagers. Resources are emerging (Flowers-Coulson, Kushner, & Bankowski 2000; Hagley, Pearson, Carne 2002; Longo et. al. 2002) to assist caregivers around Internet use. The first suggestion, as always, is to talk to children and teens. We know that most parents have difficulty talking to children and adolescents about sexuality. The Internet offers opportunities for sex education unparalleled a few years ago (e.g., www.siecus.org; www.plannedparenthood.org), including those for sexual minorities (e.g., www.youthresource.org for gay, lesbian, bisexual, and transgendered youth). In addition, there are safe places to ask questions from premier health professionals filling in the gaps where parents and sex educators leave off (Mayo Clinic 2000). Adolescence is a time of identity development, experimentation, and education (Goodson, McCormick, & Evans 2000a; Goodson, McCormick, & Evans 2000b; Roffman, Shannon, & Dwyer 1997; Shpritz 1997; Zillman 2000). The online environment offers teens a new and broader stage to “try on” differing personas, ages, and even sexual orientations (Longo, Brown, & Orcutt 2002).

[Unwanted exposure to sexual material or activity can be troubling and may even be traumatic, especially for children and youth who are not developmentally ready to handle more-adult sexual activity. Accidental encounters can happen through misspelling a URL, using a search engine without blocking software, or intrusive and sexually suggestive emails (“spam”). Purveyors of sexual materials and pedophiles may also be much more aggressive in the fairly anonymous world of cyberspace (Mitchell, Finkelhor, & Wolak 2001).

[Children and adolescents are also “at risk” for online sexual problems, online sexual compulsivity, and Internet addiction (Young 1998). Few empirical data currently exist about this area, but we know from offline life that children and teens can be sexual victimizers as well as victims. As children get older, they, obviously, are more capable of engaging in paraphilic behaviors, as well as sexually stalking, harassing, and assaulting others on- and offline. If children or teenagers meet online contacts in real time, they may also be at higher risk for transmission of STDs and HIV/AIDS (Cooper, Scherer, Bois, & Gordon 1999; McFarlane, Bull, & Rietmeijer 2002), although paradoxically, the Internet may also have unrivaled potential to help with STD prevention and safer sex efforts (Keller, Labelle, Karimi, & Gupta 2002).

#### *[Ethics and Regulation: Work Environments, Legal Considerations*

[The newness of the Internet makes ethical guidelines for behavior and regulation an evolving landscape (Plant & Donahey 2002). As individuals and groups encounter difficulties, guidelines and policies are being developed. This is happening in businesses, online service provider organizations, schools and universities, and private and governmental agencies. These responses include identifying problematic material and behaviors, as well as defining appropriate responses and restrictions (Cooper, Golden, & Kent-Ferraro 2002). The rapidly increasing usage of the Internet from the workplace has provided a brand new avenue for the availability, spread, and distribution of sexually related material and its consumption by employees with jobs that require them to go online everyday (Cooper, McLoughlin, Reich, & Kent-Ferraro 2002). In fact, approximately 50% of all Internet users use accounts that are financed by their employers, and in one study, almost 20% of the 40,000 surveyed adults reported engaging in online sexual activity while at work (Cooper, Scherer, and Mathy 2001). This corroborates data from other sources, which report that adult-

content sites are the fourth most visited category while at work (Goldberg 1998), and that 70% of all adult-content traffic occurs during the 9-to-5 workday (Carnes 2001). The implications of this phenomenon are potentially huge and of growing concern to clinical and organizational psychologists, as well as employers (Cooper, Safir, Rosenmann, Scherr, & McLoughlin, in press).

[Law enforcement at all levels, as well as policymakers and legislators are struggling to respond to new forms of sexual violence via the Net. These challenging scenarios include online harassment (Biber, Doverspike, Baznik, Cober, & Ritter 2002; McGarth & Casey 2002), cyber stalking (Deirmenjian 1999), cyper “peeping” or voyeurism/exhibitionism (Waskul 2002), rape websites (Gossett & Byne 2002), child seduction (Quayle & Taylor 2001), cybersex with minors (Jaffee & Sharma 2001), adult sex shops and pornography (Fisher & Barak 2000), child pornography (McCabe 2000; Burke, Sowerbutts, Blundell, & Sherry 2002), male violence (Cunneen & Stubbs 2000), and online pedophilia (Durkin 1997; Durkin & Bryant 1999). At the same time, other groups are concerned that control of the Internet is going too far, and thus, they are organizing to advocate for freedom and liberty in cyberspace, e.g., www.peacefire.org, which promotes computer programs capable of circumventing blocking software.

#### *[The Future of Internet Sexuality*

[The future involves harnessing the power of the Internet to improve sexual relationships (Cooper, Scherer, & Marcus 2002). In part, this means refining the research methodology (Binik 2001; Cooper, Scherer, & Mathy 2001; Ochs, Mah, & Binik 2002) and gaining access to more data in order to better understand this geometrically expanding phenomena (Cooper, Månsson, Daneback, Tikkanen, & Ross 2003; Mustanski 2001; Noonan 1998c, 2001). It is also true that the “Triple A” provides an opportunity for better, more honest, and more accurate information on all aspects of sexuality, including: sexual preference (Renaud, Rouleau, Granger, Barasetti, & Bouchard 2002), orientation (Sell 1997), sexual disenfranchised populations (Appleby 2001; Quartaro & Spier 2002; Ross & Kauth 2002; Rhodes DiClemente, Cecil, Hergenrath, & Yee 2002), the function and impact of explicit sexual stimuli (McCabe 2000; Mehta 2001; Fisher & Barak 2001), and various other atypical sexual practices and behaviors (Ochs, Mah, & Binik 2002). Also, as the Internet facilitates and makes research on sexuality easier, more will become known about the lesser-known sexual practices in various countries and communities around the globe. Already, Internet-based studies are emerging from Israel (Barak & Safir 1997), Sweden (Cooper, Månsson, Daneback, Tikkanen, & Ross 2003; Tikkanen & Ross 2000), and China (Wang & Ross 2002). If the science of sexuality is to become an increasingly recognized and respected field, then the more empirical data that can be gathered on every facet of it, the better.

[In addition to having a future, Net sexuality has existed long enough to have a past (Noonan 1998c; Stern 2001; Stern & Handel 2001). It is increasingly clear that the Internet has much to offer, both in terms of benefits, as well as some highly problematic areas, in relation to human sexuality. With more research to guide and expand the empirical knowledge base, increased attention to resources and training for clinicians and sex educators around these issues, and a more mature and sophisticated understanding of the online world, the impact of the Internet could help the world to move towards the more empowered and enhanced relationship with sexuality that most of us seek. (*End of update by A. Cooper and E. Griffin-Shelley*)]

## [Gay and Lesbian Literature in the United States: The Politics of Inclusion/Exclusion

MICHAEL HYDE

[Update 2003: The difficulty in dealing with the notion of gay and lesbian literature in the United States is having to identify what is meant by “gay and lesbian literature,” whether it be the literature produced by gays and lesbians, a literature that describes gay or lesbian experience or showcases gay and lesbian characters, or, more appropriately, some nonspecific amalgam of both. A great deal of what might actually be described as “gay or lesbian literature” has been written by authors who are neither lesbian nor gay, and just as equally, what might be—but never is—labeled as “heterosexual literature” finds its origins in lesbian and gay writers.

[This idea of a particularly gay and lesbian literature, as distinct from some other literature, is a uniquely American one as well as an increasingly dated one. The cordoning off of gay and lesbian literature from a mainstream literature arose for two reasons: from homophobia, on the one hand, and on the other, from the push of a minority culture to know and define itself. Prior to the Stonewall Uprising in 1969, literature explicitly centering on the experiences of gays and lesbians was largely an underground literature, considered subversive and part of a counterculture, produced and sold almost exclusively by lesbian and gay publishers and booksellers. Some crossover into mainstream American literature did exist, however—James Baldwin’s *Giovanni’s Room*, Gore Vidal’s *The City and the Pillar*, or Ann Bannon’s *Odd Girl Out* or *Women in the Shadows*—prior to the 1970s, but such crossovers were much more the exceptions than the rule. Other writers dealt with the pressure to conform to a mainstream literature through the use of literary masks or personae that transformed stories of same-sex desire into more widely acceptable works of heterosexual desire. In Willa Cather’s 1918 novel, *My Antonia*, for example, her first-person narrator identifies himself clearly as male, but as Cather’s novel evolves, the narrator fails in so many traditionally masculine roles that he becomes more of a mouthpiece for Cather’s own feelings of same-sex longing and affection than a fully evolved heterosexual male character (Faderman 1995).

[The Stonewall Uprising in 1969 marks what is considered by many to be the beginning of the gay civil rights movement, and subsequently, publishing witnessed a surge of gay and lesbian writing, primarily because of the heightened visibility of the gay and lesbian community. Not surprisingly, then, gay and lesbian literature post-Stonewall acquired a profound and important connection to a political movement. Lesbian and gay writers became more and more aware of the potential within themselves—whether desired or not—to become voices for and, to some degree, responsible to, a larger community.

[During the 1970s, some of the most influential literary works were notable for their frankness in rendering the experience of gays and lesbians, particularly the sexual experience of gays and lesbians. Perhaps two of the most resonant and enduring fictions were Andrew Holleran’s *Dancer from the Dance* and Larry Kramer’s *Faggots*, clear descendants of John Rechy’s *City of Night* from 1963, a fictional investigation of gay male prostitution. Both *Faggots* and *Dancer from the Dance*, published in 1978, highlighted fast-paced geographies of Manhattan nightclubs and Fire Island affluence, engaging issues of alcoholism, drug abuse, and promiscuity as reflective of a particularly gay lifestyle. Kramer’s *Faggots* had been intended as a satire of the life the novel described, but many readers engaged the work, not as social critique,

but as purely descriptive of gay life. Although both of these works sold well, to both gay and straight audiences, the works were also harshly criticized (both within and outside the gay community), as the novels seemed not only to glorify unlawful behavior and promiscuity, but also suggested a gay identity that was linked primarily to such behavior.

[Rita Mae Brown’s *Rubyfruit Jungle* in 1973 proved to be an equally groundbreaking and unapologetic celebration of lesbian sex and sexuality. Very little writing throughout the 1970s actually examined themes of growing up lesbian or gay. *Rubyfruit Jungle* offered a previously underrepresented look at a girl’s coming of age—emotionally, physically, intellectually, and sexually—as she moves from her Southern roots, in love with the head cheerleader, to a series of comedic sexual adventures. Prior to the 1970s, lesbian characters in more-mainstream fiction were relegated to two types—largely the *femme fatale* or the medical oddity (Faderman 1995); Brown’s central character signaled a sharp change in the types of roles lesbians might occupy in fiction.

[While the gay and lesbian community drew strength from this shared sense of “difference,” minority politics also creates a tension in its assertion of “sameness” to the majority—in this case, heterosexual—culture. The stories of Armistead Maupin, first appearing in the *San Francisco Chronicle* in 1976 and later collected in *Tales of the City*, evolved a world in which gay and straight characters coexisted with equal weight, the stories shifting tonally from the comic to the touching, and to a degree, shrugging off expectations of how minority characters should behave in fiction. Often, characters representative of any minority group (sexual, racial, or ethnic) have been expected to behave as positive role models for their community, but the genius of Maupin’s *Tales of the City* lay in his willingness to let his characters behave with all the positive and negative traits of their everyday human counterparts. As gay and lesbian literature started to reflect more and more the verisimilitude of lived life, gay and lesbian characters, less and less, would need to exhibit saintly behavior to be allowed a place in fiction.

[Gay and lesbian poetry during the 1970s concerned itself largely with identity politics, although themes of sexual endeavors and homosexual affections were likewise characteristic. Allen Ginsberg, made famous by his poetic treatise *Howl* (1955), continued his use of the literary medium as a forum for public shock and protest, writing about sexual desire in ways both celebratory and shocking, in *Mind Breaths* (1978). Richard Howard’s *Two Part Inventions* (1974) imagined poetic dialogues between historical and literary personae, in one exemplary case divining a conversation between gay literary giants, Walt Whitman and Oscar Wilde, placing homosexuality within a larger literary-historical context.

[Throughout the 1970s, the lesbian rights movement aligned forcibly with the feminist movement, producing some of the most powerful poetry in American literature. So much of lesbian feminist poetry during the 1970s and into the 1980s worked to articulate the desires and concerns—as well the epistemological stance—of the lesbian and feminist movements, building on groundbreaking ideas from such radical idealists as Andrea Dworkin, whose *Woman Hating: A Radical Look at Sexuality* (1974) revolutionized thinking about the roles of gender and sexuality in America. Lesbian feminist poets like Adrienne Rich (*Diving into the Wreck*, 1973; *Twenty-One Love Poems*, 1977) and Marge Piercy (*The High Cost of Living*, 1978) pushed for a redefined sense of womanhood that was all inclusive and empowering, and the poetic voice became one of protest and deep sensitivity where goals of feminists and lesbians could unite in the push for change (Bennett 1995). Adrienne Rich’s notion of a “lesbian continuum”—along which all women could situate

themselves in terms of their affection for fellow women—greatly influenced the work of lesbian feminists, theorists, and writers throughout much of the following decade.

[In the 1980s, lesbian writing continued mainly to be a vehicle for voicing social concerns and identity politics. Audre Lorde, a black lesbian feminist, emerged as a powerful voice with *Zami: A New Spelling of My Name* in 1982 and, in 1984, with *Sister Outsider*, a collection of influential essays concerning race, gender, sexuality, and identity in America. Lorde's writing, although forceful and unapologetic, exhibited a profound grace and sensitivity to peoples of all racial, gender, and sexuality orientations, and her firm belief in the connection of her own lesbian sexuality and black heritage as one linked identity, assisted in unifying efforts for change within both minority communities. Chicana writers, Gloria Anzaldúa and Cherrie Moraga, dissatisfied with what they viewed as the backseat role of non-whites in the feminist movement, compiled *This Bridge Called My Back: Writings by Radical Women of Color* (1981), which articulated the challenges of simultaneously occupying two minority positions (racial and sexual) in America. Writer and cultural theorist, Sarah Schulman, notable for her risky and experimental styles, examined the relationship between aesthetics, politics, and identity. In *The Sophie Horowitz Story* (1984), for example, a lesbian reporter trails feminist bank robbers, and Schulman's novel jabs at the essentially misogynist tendencies in the detective-novel genre. In her challenging of traditional narrative forms, Schulman examines the role of art in shaping politics and social change, encouraging her readers to question *meaning* and how meaning is derived. During the latter half of the 1980s, the detective genre became a popular medium for lesbian writers in general, evidenced by Katherine Forrest's *Murder at the Nightwood Bar* in 1987 or Mary Wings' *She Came Too Late* in 1987 and *She Came in a Flash* in 1988 (Summers 1995).

[Much of gay fiction during the early 1980s followed in a new form of *bildungsroman*: the "coming out" story. As gay and lesbian communities moved toward a renewed sense of solidarity, "coming out" stories allowed their own writers the possibility of self-expression and self-healing and afforded their gay and lesbian readers the knowledge that they were not alone in feeling the stresses of a minority culture. Edmund White's *A Boy's Own Story* in 1982, a semi-autobiographical fiction, epitomized the subgenre, following an adolescent's coming of age and of sexual identity in the American Midwest. Remarkable for its emotional openness and frank description of sexual encounters, *A Boy's Own Story* reached both gay and straight readers. Randal Kenan's *A Visitation of Spirits* (1989), set in the American South, followed in a similar vein, treating themes of race and homophobia, as a family comes to terms with a son's sexual identity. In the way that White's Midwestern landscape shows the power of geography on identity, Kenan's *A Visitation of Spirits* takes a virtually unprecedented look at the intersection of race and homosexuality within a particularly volatile Southern landscape, with consequences remarkably divergent from the geographies of suburban and urban luxury and escapist indulgence characteristic in the fiction a decade before.

[Historically, gay and lesbian communities have been joined under the same aegis of homosexuality, often without taking into account the effect of gender on this singular label of homosexuality and how distinctly lesbian and gay communities do emerge, one from the other. In the latter half of the 1980s, as lesbian writing focused on gender politics and gay justice, gay male writing centered more and more on the sudden AIDS crisis that seemed so endemic to the culture of gay men living at that time. Paul Monette's *Borrowed Time: An AIDS Memoir* (1988) was written after the death of his

lover to AIDS and proved to be one of the most powerful books ever written concerning the experience of AIDS and its aftermath of personal loss. Andrew Holleran's *Ground Zero* (1988), David Feinberg's *Eighty-Sixed* (1989), and James Purdy's *Garments the Living Wear* (1989) all touched on the epidemic that so affected and began to describe gay communities throughout the late 1980s. Journalist Randy Shilts' book, *And the Band Played On: Politics, People and the AIDS Epidemic* (1987), detailed the effects—both small and large, personal and bureaucratic—leading to the spread of AIDS throughout the United States and the devastation, in the wake of the religious-conservative backlash, felt supremely within the gay community.

[The subject of AIDS continued to be a topic of gay writing throughout the 1990s. Playwright Tony Kushner's work brought the crisis to both heterosexual and homosexual theater audiences. Kushner's *Angels in America: A Gay Fantasia on National Themes* existed in two sections, *Part I: Millennium Approaches* (1992) and *Part II: Perestroika* (1993), and showcased main characters infected with AIDS. The play worked to characterize the state of America not only in terms of sexual identity, but racial and ethnic as well. *Part I: Millennium Approaches* appeared on Broadway in 1993 and won the Pulitzer Prize for drama that year. In some sense, the medium of theater first showed the signs of gay-subject or gay-themed work reaching a large audience in a formidable way. Jonathan Larson's widely popular and critically successful musical, *Rent*, which appeared on Broadway in 1996, likewise featured gay personages, one of whom dies of AIDS. Larson, himself, was not gay, but his work underscored a heterosexual concern for the AIDS epidemic that had been so widely regarded as a gay disease, and also announced an emergence of a "gay literature" into a more mainstream venue.

[Until the beginning of the 1990s, lesbian literature had functioned primarily as a polemical literature, advancing a politics and an agenda as opposed to attempting appeal to a wider, non-lesbian readership (Faderman 1995). Throughout the 1990s, however, literary works appeared that posited a lesbian identity as only one facet of an individual's identity, in a way making the lesbian agenda appear gentler and closer to mainstream. Jenifer Levin's *The Sea of Light* (1993), Paula Martinac's *Home Movies* (1993), Carol Anshaw's *Aquamarine* (1992) and *Seven Moves* (1996), and Blanche McCrary Boyd's *The Revolution of Little Girls* (1992) offered glimpses of lesbian characters not bound fully by lesbian communities, but integral to and incorporated into a more everyday America. Dorothy Allison's *Bastard Out of Carolina* (1992), a finalist for the National Book Award, fictionalized the author's own harsh experience growing up lesbian in the South, and garnered both critical and popular success.

[One work of gay literature to have had perhaps the biggest reach throughout mainstream America was Michael Cunningham's *The Hours* (1998), a novel inspired by Virginia Woolf's *Mrs. Dalloway*. *The Hours* imagines the lives of three separate women—Virginia Woolf being one of these—interweaving the three stories into a singular narrative movement. *The Hours* spent weeks on *The New York Times* Bestsellers List, was awarded both the 1999 Pulitzer Prize and PEN/Faulkner Award, and was adapted into a recent film of the same name, starring Nicole Kidman, Meryl Streep, and Julianne Moore.

[The popularity and success of *The Hours*, perhaps, signals the disappearance of a gay and lesbian literature as separate from some otherwise "mainstream" literature, and hints at a future of assimilation, in which "homosexuality" will not be placed in opposition to a "normalcy." To a certain degree, media and advertising have allowed a greater visibility

and viability of the gay and lesbian communities that help to afford their literature a place with booksellers (Shulman 1998; Arnold 2003). However, a clear distinction seems to exist between a literature that shows gay and lesbians as affectionate, which is permissible, while a literature showing gays and lesbians as sexual or desirous, is not. In 1997, for example, David Leavitt's novella, *The Term Paper Artist*, was pulled from publication in *Esquire*, after chiefs at the magazine feared advertisers would be offended by Leavitt's descriptions of man-to-man oral sex; the censorship of Leavitt's piece caused long-time *Esquire* literary editor, Will Blythe, to resign in protest of the magazine's decision.

[As gay and lesbian literature moves to become more mainstreamed, opinions differ on whether this will be a good or bad thing. Those reluctant to the mainstreaming of a gay and lesbian literature—and of gay and lesbian culture in general—fear that certain stories and certain voices might falter to homogenization. Publishing trends, however, reveal that new commercial markets have been opening up for gay and lesbian writers, not just in terms of literary fiction and poetry, but also in terms of the genre fictions (e.g., detective, romance, and horror) geared toward gay readers (Arnold 2001). Such growth and evolution seems promising, not only for gay writers and readers, but also for the roles they might play and occupy within the larger culture of the United States. (End of update by M. Hyde)]

### **[Varied Sentiments: The Expression of Sexuality in Music**

RAYMOND J. NOONAN

[Update 2003: It has been said that each generation thinks it invented sex, that it was the first to discover one of life's most magnificent treasures. Perhaps nowhere is this more evident than in the musical record of each generation's contribution to the lyrics of its age. What is important to a generation—and to a society—can be found embedded in the lyrics of its popular songs. One way to evaluate the validity of sentiments expressed in the music is to observe how often people choose to listen to it in their free time—and like sex, enjoying music is a most popular pastime. And by far, one of the most prevalent themes found throughout this repertory, past and present, is that of romantic love—and, if one looks deeper, the celebration (as well as sometimes the denigration) of sexuality—in all its permutations. For most people, their relationships are what provide meaning to life. Music, the mirror of life, reflects the best and worst of life back to us, from anger and sexism to the profoundest love and eroticism.

[Studies of the arts with predominantly sexual themes—sometimes called the “erotic arts”—has a long, if sometimes not wholly respected, history, with treatises on sex in literature, the performing arts (e.g., film, video, theater, and performance), and the visual arts (e.g., painting, drawing, photography, and sculpture) being the best represented in both the academic and popular literature. All of these lend themselves to the printed page by affording the author and reader the benefit of photographs and film stills as illustrations of the text. Music, however, has not lent itself as effectively to books and journals, or any of the traditional print media. In printed form, music notation requires some skill to interpret and some musical talent and training to even approach an understanding of how the piece is supposed to sound, or sometimes even to discern what verse follows another. Furthermore, the printed notation of most modern (popular) music only provides a bare-bones outline of the words, melody, rhythm, and accompaniment of any particular song. The “arrangement” chosen by the artists, as well as the individuals' or groups' own innate voices and styles, then create the distinctions that separate one version of the

song from another. Just as the printing press revolutionized the collection and dissemination of knowledge, and engravings and photographs made it possible to illustrate a text with a picture worth a thousand words, so, too, are advances in multimedia computer technology revolutionizing the future of all literature by allowing us to create texts that can be viewed on electronic screens accompanied by both high quality images and sound. Thus, we are beginning to see hypertext “books” on compact disk (CD), digital versatile disk (DVD), and on the Internet illustrated with examples derived from moving video pictures as well as “snapshots” of digitally recorded or “sampled” sounds taken from diverse sources. Histories of music are coming alive.

[What follows is a review of various musical genres and the way principally American songwriters have addressed or portrayed sexuality in their lyrics. It will proceed largely from where other writers have left off. Of necessity, the review cannot be comprehensive because our musical heritage—even what currently exists in recordings—is so extensive. We will, however, review the highlights of what Cray (1969) called the “Erotic Muse,” the myriad ways in which sexuality has appeared in our musical literature, with an emphasis on the music of the United States and the English-speaking Western world during the last 200 years. We will elucidate the sentiments expressed and, to some extent, their meanings within their time and culture. We will not delve deeply, since this has been done elsewhere as noted below, into the sexual aspects of music purely as sound and rhythm, or as a motivator, subtext, or accompaniment to movement or dance or lovemaking.

### *[Historical Antecedents*

[As a subject for serious writing, either academic or journalistic, the profoundly important and eternal interrelationship of sexuality and music has had relatively little written about it in the past few decades. The sole exceptions have surrounded publicity about attempts by small but vocal self-styled censors within government and a few private parents' groups to promulgate “studies” which “prove” the harm to children, women, and others that sexually explicit lyrics in popular music—dubbed “porn rock” by critics—has caused. This reflects, in general, both a deep ignorance of the long connection of sexuality and music and an almost universally inadequate comprehensive sexuality education program or critical-thinking component of most education. It is exacerbated by an official predisposition to conceptualize sexuality primarily in terms of its sometimes problematic aspects accompanied by largely hypocritical moral pretexts, and to focus on useless, superficial, or oppressive “solutions.”

[By the early 1960s, few scholars with training in the sexual sciences had explored the topic of sex and music. Of those outside of sexology who did, the most important studies were by musicologists interested in tracing the lineage of popular folk songs from the traditional music that had been passed from generation to generation of the common people through oral transmission. While a large part of this oral tradition in English probably has been lost, much of it was collected by folklorists in England and America during the folklore revival of the 1800s (and during the two centuries previous in England and other countries) and stored hidden in various libraries across the world. What music scholars discovered was that many of the original songs from which the folk songs were derived embodied sexual situations described with explicit imagery. These songs, when finally written down, were then passed on to posterity only after they had been revised or obliterated to conform to the “moral” expectations of the educational, religious, and

political leaders of each era. The importance of these discoveries will be discussed shortly. The reader is referred to Cray (1969) and Reeves (1965) for a more complete history of the process that occurred and the mechanisms that probably took place. Oscar Brand (1962), himself a scholar and folksinger, writing on the modern American folk song revival in the 1960s, discussed a similar process, though with some differences, that occurred during the ascendancy of folk music at that time, and its impact on today's music.

[Bridging this interest in folklore with sexology is *The Horn Book* by Gershon Legman (1964), by far the most important study of eroticism in folklore and folk song that has ever appeared in the English language. A former bibliographer for Alfred Kinsey, Legman, an erudite scholar with a breadth and depth of knowledge of erotic folklore equalled by none, looked at and evaluated the written record of erotic literature and music that had been amassed by collectors of erotica during the past 500 years, the sum of which appears to have been largely unknown by other scholars. His work clearly elucidates the role that sexuality has played in the history of music in all cultures in all times and should provide scholars with a foundation upon which any research or discussion of sexuality and music henceforth will be based.

[The earliest consideration of the topic in the sexological literature was written before 1910 by Havelock Ellis (1936b) in his opus, *Studies in the Psychology of Sex*, in which he discussed the influence and effects of music on animals and man and the roles he believed it played in arousing sexual attraction within the framework of Darwin's model of natural selection. Among general surveys of sexual science that have appeared more recently, the most extensive review of sexuality in the music of the Western world was an article by MacDougald (1973) in *The Encyclopedia of Sexual Behavior*, edited by Albert Ellis and Albert Abarbanel (1973). Laemmel (1976) also briefly covered the topic in his overview of sexuality in the arts in the mostly psychiatrically oriented volume edited by Sadock, Kaplan, and Freedman (1976). Webb (1975) provides the most comprehensive perspectives on all the erotic arts, including insightful sections devoted to popular music and musical theatre, in which he highlighted some of the developments in musical eroticism that had also occurred through the 1960s. MacDougald (1973) noted that, by the time he wrote his article in 1961, only eight scientific studies, none of them definitive, existed about the interrelationship of music, "the most expressive and least tangible of the arts," and sex. In his survey, he discussed the transition from religious to secular music and the rise of the classical tradition in which woman would become a vital part of a previously all-male world. He also considered some of the popular forms of music up to the 1950s, including Latin American, modern, and jazz dancing, and some of the popular singers of the 1940s and early 1950s.

[Rock 'n' roll, which originally appealed primarily to the young—and which became so problematic for so many adults since its inception because of its inherent sexual overtones—was in its infancy, and so was not treated at all by MacDougald (1973). So, too, were two of the antecedents of rock music—folk music and the blues—not covered, because so many of these songs, as noted above, were suppressed and hidden from view. Then, too, traditional demarcations of culture into "high" and "low," as well as generational biases, may have played a part, in which certain forms of culture were not deemed worthy of scholarly consideration. Webb's (1975) observations on rock 'n' roll and the blues, as well as the musical theater using a rock format, were more salient, because he wrote his analysis from a perspective that benefitted from its occurring during a phase of the latest sexual revolution that overlapped almost two

thirds of the two decades of rock history at the time he wrote it. Laemmel (1976), on the other hand, devoted only several superficial paragraphs to the subject. Nashville-style and other country music had not yet fully developed or matured into the form we know it today, and so was not considered by any of these writers. The profound revelations in folk music noted above also seems to have been unknown to them.

[The Ellis and Abarbanel (1973) volume, however, did include an article on sexual dynamics in dance in which Nikolais (1973) traced the role of sexuality in and on modern dance from Isadora Duncan onward, including psychological interpretations of art by Freud and Jung and their application to dance; another article by Goodman (1973) discussed social dancing, where the dance was shown to symbolize the erotic interactions of men and women in a mutually enlightening, socially acceptable way that allowed them to move together or withdraw gracefully as they so chose. (This is reminiscent of D. H. Lawrence's (1936/1953) reference to Romeo's statement, "To me, dancing is just making love to music," to which Lawrence responded, "To the music one should dance, and dancing, dance.")

[MacDougald (1973) traced the historical connection of sexuality and music by noting that many musical instruments originated as representations of the genitalia whose primary use was to celebrate the functions of sex and/or fertility by early peoples. For example, in the Pacific islands, Africa, and Asia, some early drums were shaped as, and represented, the vulva and were played with a drumstick representing a phallus. The flute also has been historically identified as a symbolic penis. MacDougald (1973) wrote,

Although this symbolic identification might seem naive to us, it has had great significance in many sexual manifestations—circumcision, menstruation, ceremonies, dances, rituals, etc.—around the world. In a number of European languages the word "flute" has definite sexual connotations, cf. the English expressions "the living flute," "the silent flute," "the one-eyed flute," etc. as in "The Cupid" (1736) Farmer:

The flute is good that's made of wood  
And is, I own, the neatest;  
Yet none the less I must confess  
The *silent flute's* the sweetest. (p. 747)

[A similar symbolism continued into the 17th-century classical baroque period in Europe, during which a number of "love instruments" that symbolically connected Eros and music came into wide use, including the *viola d'amore*, the *oboe d'amore*, and the *clarinette d'amour*. Even in the 20th century and since, the manner in which some rock and blues musicians play their instruments suggests a strong connection to their erotic origins.

[While the intent of much of the music prior to the Middle Ages was purposely sexual, medieval music took on a specifically nonworldly religious tone under the Roman Catholic Church. After the Dark Ages, however, secular interests began to signal the emergence of the Renaissance that would begin in a few centuries. Sexual love would prove to be a strong impetus toward that artistic and intellectual revival and began to make its appearance in music, as well as the other arts.

[Ballads and lyrical songs about love apparently were the first nonreligious songs written, appearing in Europe during the 12th and 13th centuries in Provence in the south of France. The poet-musicians who wrote them were called *troubadours* and were usually members of the nobility, often knights, and sometimes commoners. Their music and

poetry, which were devoted to chivalrous love, later spread to the north of France where *trouvères* imitated the new movement. From Provence, also, the love poetry and music of the *troubadours* spread to Italy and, more importantly, to Germany, where the *minnesingers* developed their own narrative style, being less formal and less distant than their French counterparts (Apel 1969).

[Out of the writings of the *troubadours* and *minnesingers* of this era came a bold new concept that would give people a glimpse of some future era: a view of woman as active and passive, in MacDougald's (1973) words, "a feminine creature to be loved and to love." This is perhaps the most important development in the secular musical celebration of the vernacular of Europe, and it stood in stark contrast to the Catholic religious music that had dominated the continent for a millennium. This movement eventually evolved into the 16th-century classical tradition of the Renaissance, during which madrigals were composed in which woman and love were mere abstractions. MacDougald (1973) wrote,

[... D]uring the Dark Ages Christianity effectively stifled the composition of secular "emotional" music, resulting in a thousand long years in which virtually no love songs, certainly one of the fundamental urges of the human heart, were composed! Although the musical dictatorship of the Church was ironclad for centuries, it could not restrain the natural inherent desire of man to sing of nonchurchly things. (p. 748)

[Thus, secularity began to merge with sacred music, paralleling, but lagging centuries behind, the gains realized during the emergence of the *troubadours* and those who followed their spirit. It is interesting to note that, in the classical tradition, there is a distinction between the art song (created with serious artistic intent by accomplished musicians) and the folk song (arising in the vernacular of the common people by untrained musicians). It could be said that the folk (i.e., popular) songs of the day that arose from the people were analogous to the vulgate of the Catholic Church, that is, both were in general circulation and both were for the masses (cf. *vulgar*, of the common people). In that sense, it can be seen how all nonclassical music might be considered vulgar (or, by extension, obscene, following the modern corruption of the word). Thus, we see a similar pattern during the 16th through the 20th centuries, particularly with regard to the folk and blues songs that arose from ordinary people in their day-to-day lives, that contrasted with unofficially or officially sanctioned popular music that avoided, but did not always completely destroy, the emotionality derived from sexual eroticism. The second millennium would finally end with a rich literature of songs specifically confronting and affirming our sexual heritage on a variety of levels. The reason for the love song's primacy in this new secular order are seen quite clearly by Legman (1964):

Erotic poetry, especially in the form of song, is extremely ancient. It was considered by the Greeks to be a special form of the poetic art, with its own muse, Erato—she with the lyre—indicating the intimate relation to music. This relation is always sensed, as to erotic poetry in particular, and is clearly admitted by the repressive religious objection to all music other than that used in worship, and even there with the prohibition of certain too 'sensual' instruments and 'lascivious' modes. . . . The only other forms of poetry thought worthy of muses by the Greeks were lyric and heroic poetry (that is to say, songs and ballads, but on themes other than erotic), and these were understood to be derivative. They could hardly have preceded love poetry, or rather love song, which is, after all, not unique to the

human species or even to the mammalian order. The love-calls and sexual displays of any number of male animals and birds, even insects . . . imply a long pre-history of erotic song and erotic dance, as integral parts of the sexual approach of living creatures, long preceding the appearance of human life on earth. (p. 408)

[By the turn of the 17th century, a new form of musical expression was being developed in Italy in the classical tradition (but with additional roots in the folk tradition, as Legman (1964) notes)—the opera—that was to continue the trend of introducing woman, not as a symbol, but as a human being with a host of human characteristics, good and bad, into European music. The reader is referred to MacDougald (1973) who has summarized these developments in detail with numerous examples from the operatic repertoire. I will note simply that he attributes chiefly to Mozart the transition of woman from being nonexistent as an active, motivating force at the end of 16th century to being an integral and vital part of the classical operatic tradition by the end of the 18th century. Laemmel (1976) states further that the overture to Mozart's *Don Giovanni*, which immortalized the Don Juan theme, "initiated the romantic movement in music by dramatizing the eternal battle between the sexes." Sexuality, love, and sensuality would reach a pinnacle in classical music in the 19th and early 20th centuries with operatic and symphonic works, some performed with the eroticism underscored in ballet, by Wagner (*Tristan und Isolde*, 1865), Bizet (*Carmen*, 1875), Rimsky-Korsakov (*Scheherazade*, 1888), Debussy (*Prélude à l'Après-midi d'un Faun*, 1892-1894), Stravinsky (*Le Sacre du Printemps*, 1913), Ravel (*Bolero*, 1928), Shostakovich (*Lady Macbeth of Mtsensk*, 1934), and others.

[An illustration of the response of the media provides some insight into the impact that one of these operas had when it was performed. "Shostakovich is without a doubt the foremost composer of pornographic music in the field of art," said one critic in 1955 (MacDougald 1973) in reference to the sexual imagery of *Lady Macbeth of Mtsensk*, while the Soviet *Pravda* criticized how, in it, "'Love' is smeared all over the opera in the most vulgar manner" (Gillespie 1968). Legman (1964) notes further how popular dances, such as the "Bunny Hug," the "Turkey Trot," the "Tango," the "Shimmy," the "Twist," and others since the 16th century, all evoked religious and moral opposition when they first appeared. People today are seldom aware of how ubiquitous self-styled 'defenders of the public morality' have been, and that virtually every new form of music and dance was criticized on those grounds throughout history with varying degrees of success in their suppression.

[In the first decade of the 20th century, an important form of vocal and instrumental music indigenous to America was introduced by Jelly Roll Morton called "the blues." Soon afterward, "jazz" appeared as the background music in the brothels of New Orleans, co-evolving with the blues from ragtime, minstrel-show music, and early brass and string bands (Abel 1969; Webb 1975). Laemmel (1976) notes the erotic roots of jazz, the first major artform to be born in America, and suggests the name's derivation from *jass*, a sexual term in a Creole dialect for the Congo dances. By the middle of the 20th century, this new type of music, more overtly sensual, was having a significant impact on musical expression. The rhythm of swing by such artists as Louis Armstrong, Benny Goodman, Duke Ellington, Gene Krupa, and Lionel Hampton had solidified "the beat" as a necessary component of popular music and jazz. Because rhythm is an inherent component of sexual activity, rhythm in music is considered an aspect that cannot be divorced

from its sensual and sexual overtones and their relationship to dance. This period was also the time when the voices of popular stars like Peggy Lee, Sarah Vaughan, and Lena Horne evoked sexual feelings in their audiences, as did the voice of one of the first teen idols, Frank Sinatra. MacDougal (1973), presumably reflecting his own generation's attitudes toward the music of his youth, describes one of the most important composers of that period, whose lyrics boldly and uniquely expressed specifically sexual themes:

When the subject of sex and popular music arises, one automatically thinks of that genius, Cole Porter, whose *oeuvre* is a kind of musical erotikon, to use an apt word. The lyrics that Porter writes are admittedly the "sexiest" of any writer and it is contended that he likewise composes "sexy music." It is undeniable that his songs . . . do possess a haunting appeal that induces an erotic mood.

[Porter's songs, indeed, have a universal appeal—perhaps because of their eroticism and positive affirmation of the power of love—that has helped his music survive into the rock era. His songs continue to be recorded by contemporary artists of all musical persuasions, the 1990 collection of Porter songs, *Red, Hot & Blue*—recorded by various artists both as a tribute to Porter, who had to hide his homosexuality to practice professionally, and as a means of benefiting AIDS research and relief—being a noteworthy example. As such, one could call Porter the first modern songwriter in the contemporary popular song idiom. He was the muse whose musical influence most directly presaged the range of sexual ideas expressed in the lyrics of music popular in the closing decades of the 20th century to the present.

[Describing Porter's lyrics as "sexy" also introduces three of the predominant underlying questions usually asked about sexuality in musical lyrics, one's answers to each betraying a different philosophical stance in the continuing debate on the topic: How does the vocabulary a songwriter uses influence the response to the music—both by the intended audience and by would-be censors? What is the purpose of sexuality in music today and is it necessary for song lyrics to depict only "acceptable" behavior and feelings? and Is it a legitimate function of songs to excite or seduce, i.e., to "turn on" the listener by creating an erotic mood?

[At the same time that Porter's songs would enjoy wide popularity, "race music" would, by the 1950s, be limited to black venues and audiences. This genre would often be more sensual and sexually direct than their white counterparts. Nevertheless, these songs would soon be introduced to white audiences, as various singers in the 1950s, especially Elvis Presley, began adapting ("covering") what became known as rhythm and blues, which is sometimes still used synonymously for much of this early black-inspired rock 'n' roll. Still, these covers were typically more suggestive than direct.

[Simultaneous important developments would emerge in the 1960s, a renaissance decade in American popular music. At the dawn of the decade, black performers with artistic roots in rhythm and blues would lay the groundwork for what would later be known as soul music. Groups such as the Supremes, the Temptations, and others exemplified the so-called "Motown sound," while the Ronettes, the Exciters, and others pioneered the innovative recording techniques of Phil Spector's "wall of sound." The dominant sentiment expressed in much of this music was that of teenage love with only the mildest hint of sexuality, *per se*. In the meantime, the Beatles ushered in a new era in popular music, a revolution which quickly influenced and reflected the growing "youth culture," which, with the new sexual revolution, the civil-rights movement, worldwide student pro-

tests, and the new psychedelic-drug era, spawned a host of American and British rock groups. They, too, were influenced by rhythm and blues. Finally, by the end of the decade, the folk revival began, which was more heavily influenced by the social movements mentioned above, with Bob Dylan, Joan Baez, and others, especially Dylan, paving new paths, which would later merge with rock as folk-rock, probably the first of rock music's eclectic penchant for fusing with other musical styles. In 1969, Dylan experimented further with country music in *Nashville Skyline*, which contained the well-known specifically sexual song, *Lay Lady Lay*. Country songs by both male and female artists would, in the 1970s and beyond, also focus on sexual themes, including premarital sex, adultery, divorce, and other topics, such as Loretta Lynn's celebratory song, *The Pill*.

[Popular songs with sexually explicit lyrics would remain mostly invisible until rap music became widely popular in the 1990s. Similar developments occurred among largely white audiences with heavy metal and other minor genres of rock music. Rap music is rightly considered the most significant American musical innovation since jazz. Arising from the urban-ghetto experience of young blacks, rap has antecedents in both African-American rhythm and blues (R&B, the immediate predecessor if not the actual beginning of rock 'n' roll) and the "talking blues" of early American folk music, both of which became more widely popularized in the 1960s as noted above. Additional roots derive from the Caribbean as well as the Negro spirituals of the black slave experience. Rap is itself not a single genre, but has been broken into various "topical" areas, such as hip hop, as well as along geographical lines, i.e., New York City versus Los Angeles. Widely popularized across both black and white audiences in the United States, as well as other races and internationally, during the 1980s, rap, since the 1990s, is heard on radio and television and in the movies. As one might expect, based on our previous discussion of sexual expression in song lyrics, sexuality has come to play an integral part of rap lyrics.

[The most controversial form of rap, not surprisingly, therefore, are those songs which express sexual ideas—or more precisely, those that use unconventional "street" language to express these ideas—in their lyrics. The group which, in its early years, most typified this genre, variously known as "explicit" or "dirty" rap, was 2 Live Crew, a rap group based in Miami, Florida, in the 1980s. In fact, 2 Live Crew would go on to relive, in a sense, the path followed by Lenny Bruce through arrests and the courts in his groundbreaking comedy bits, which similarly used street language and sex, as well as satirical jabs at religion and politics, in the 1950s and 1960s, paving the way for today's standup comedians. Of particular significance is a word that they used and other performers continue to use today, the expletive *fuck* and its various derivatives, which, although it has its obvious sexual meaning, is more often used to signify camaraderie and shared generational experiences—an important aspect of the music of youth—as well as a host of other nonsexual meanings. Still, sex is where these words derive their power. Numerous other black artists would further develop the rap idiom with explicitly sexual themes or language, along with a few white artists, most notably, Eminem.

#### [*Sexual Themes in Popular Song Lyrics*

[Musical lyrics could be a goldmine to sexologists, as well as to any student of human nature who takes the time to listen to their content and context. While many say that the beat, with its "primitive" cadence suggesting sexual rhythms, is the prime motivation behind many forms of today's popular music, the lyrics—perhaps more so than the instrumental parts of the songs—embody the wide range of

expression we conceptualize as sexual. In contemporary Western culture, the music and the beat provide the background for our sexual, social, and private lives—even our work lives—especially for the young, but also increasingly for the rest of us. Indeed, it has been so for people of all ages in all cultures in many parts of their lives throughout the centuries. Yet, it is the lyrics on which many adults focus today—particularly those intended for young audiences—because of their often sexual content. MacDougald (1973) has noted that one of the problems in examining the relationship of sex to music is the confounding nature of “association,” that which imparts meaning to a song without its necessarily being explicitly sexual. Thus, a title suggesting romanticism, or even the situation in which a song is experienced, will color one’s perception of the erotic attributes of a song or its effects on any particular listener. Noonan (1998b) has also noted how one’s own personal successes and failures in intimate relationships can have a similar impact on one’s perception of sexuality in other sociopolitical contexts.

[While the underlying eroticism of early rock ‘n’ roll was subject to criticism since its beginnings in the 1950s, (it is well known by now that the very term *rock ‘n’ roll* is a euphemism for sexual intercourse), the lyrics tended more to suggest sexual situations than to describe or depict them directly. As rock has matured, this has become less so. As the “baby boomers” got older, their music began to reflect more of the issues they considered important—and sexuality at the beginning of the current sexual revolution which began in the 1960s and continues to evolve—was a most important part of life. Not that suggestion has been any less represented on the contemporary music scene, but our perception of it has changed. What appears to offend many people today, at least ostensibly, is the explicit slang that has become apparently more prevalent than in the past. Part of this perception has arisen from the fact that, while the use of this language has probably not increased in daily life during the rock era, the airing of the language via the public airwaves, both on radio and television, has increased as restrictions by government agencies like the U.S. Federal Communications Commission (FCC) have gradually eased. This has been attributed, at least in part, to the rise of cable television networks (as well as video rental stores) which allow viewers a greater choice of viewing options—and viewers have tended to choose the more “adult” options, i.e., those that reflect the language and situations that make up their world or their dreams. Indeed, given the choice of an “edited-for-television” film and its uncut version, most will choose the original—and broadcast stations make a point of noting with much fanfare when a particular film is being shown for the first time “in its entirety” within its broadcast area. Others have noted how versions of popular theatrical films are sometimes released in two versions: an R-rated (restricted) American version and a complete version (with more sex) for Europe, South America, and other areas in the world.

[Simultaneously, both broadcast and cable television networks, most notably Music Television (MTV), began exploiting a new artform, the music video—a powerful marketing tool for selling recordings that was discovered in the early 1980s—which became increasingly popular. While their kinetic energy was ideally suited to the young and to the medium, music videos have greatly influenced many other forms of commercial fare, especially television advertising, as well as live theater and film, with music videos even aimed at adult audiences appearing in large numbers with its own music network, VH1, as well as networks aimed at various ethnic audiences (e.g., Black Entertainment Television, BET, and the various flavors of MTV). A discussion of the sexual content of the visual part of music

videos is beyond the scope of this article, but suffice it to say that music videos have generated at least as much concern for the shallow and stereotypical ways in which they depict sexuality and the sex roles of men and women as for the presumed sexual messages they promote. Some have even argued that music videos and the recordings they represent are promoting sexual activity among those who would not otherwise tend to be sexual. While few professionals seem to have refuted the illogical argument that sex needs to be promoted, that argument has been used with great emotional force in the suppression of both sexually explicit—and sexually implicit (“suggestive”)—lyrics over the last two centuries. (*End of update by R. J. Noonan*)

### [Seduction of Fashion: A Sociological Perspective

RUTH P. RUBINSTEIN

[*Update 2003:* The seven deadly sins were guidelines for behavior instituted by Judeo-Christian authorities as central to an orderly social life (Lyman 1978). The importance of each of these cultural constructs depended upon the political context of a particular period. Throughout the history of Western society, however, expectations and behavior were gender specific, where men were expected to work and women were expected to follow. Moving up the social-class structure and employment outside the home as avenues of getting away from family authority were usually closed to women. They depended upon the men in their family. To attract a man, a woman had to stand out. Fashionable attire evolved around arousing male/female interest and entailed the violation of two of the seven deadly sins—the sin of lust and the sin of pride.

#### [*The Sin of Lust*

[Women’s fashions sought to arouse male interest in two distinct ways: It demonstrated her family’s wealth and encouraged male lust. Clothes that hug the body, expose the body, and use a variety of color and ornament, Church fathers decreed, distracts male attention from spirituality. Hence, women should refrain and focus on modest attire. In the Church’s first 500 years, women were exhorted to renounce male dress and to cover their heads as a sign of subservience to men (I Cor. 11:4-10; I Cor. 14:34-35; I Tim. 2:11-15; Reuther 1974).

[Lust was the longest recognized, best known, and always a part of the seven deadly sins, observed sociologist Sanford Lyman (1978). He notes that marriage is a link, not only to the wedded couple, but also to families, lineages, and status groups. For this reason, sexual expression is an objective of societal control mechanisms (Lyman 1978, 92).

[St. Augustine had observed that the male organ activates itself independent of desire. It is independent of a male’s will, responsibility, and control. It was only after Adam and Eve sinned did they recognize that they were naked—that they were stripped “from the grace that prevented the bodily nakedness from causing them embarrassment.” Thereafter, all mankind was afflicted with what Augustine referred to as “the insubordination of the flesh.” This insubordination resulted in a sense of shame (Lyman 1978, 55).

[Augustine’s lust-shame theory accounted for the near-universal covering of male genitalia. The liberation of lust from human will accounted for the origins of the injunction for female modesty, the requirement for privacy during sexual intercourse, and the grudging necessity for marriage (Lyman 1978, 56-58).

#### [*The Sin of Pride*

[Theologians and social commentators locate the sin of pride in men and argue that men adorning themselves indi-

cates pride. According to Allanus de Insulis, the evil in the sin of pride is that the prideful man is removed from sacred and communal constraints. He divorces himself from its kind, disregards his associates, separating himself from those who can restrain him. It is a person with a haughty ego. The human frame itself is pressed into service in behalf of arrogance (Lyman 1978, 141).

[Gregory the Great argued that pride entails arrogance that emanates from within the person, where the male favors himself in his thought. He silently utters his own praises and uses attire to glorify himself (Lyman 1978, 136). Georg Simmel relates male pride to the wearing of adornment. He suggests that adornment “intensifies and enlarges the impression of the personality by operating as a sort of radiation emanating from it” (Lyman 1978, 142). “The personality is more when it radiates” (Lyman 1978, 143).

[The phenomenon of fashion began as an expression of male pride. It emerged in the court of the Duke of Burgundy, Philip the Bold, in the late 14th century. For a great feast at Amiens he appeared in a voluminous black-velvet overcoat with long wide sleeves (*houppelande*), the left sleeve of which was decorated with roses worked in gold, sapphires, rubies, and pearls (Kemper 1977, 77). Philip’s successors—John the Fearless, Philip the Good, and Charles the Bold—continued to emphasize clothes that reshape the body and emphasize sartorial splendor (Kemper 1977, 77).

[In the collection of her Majesty, the Queen of England, there is a painting called “The Field of the Cloth of Gold” (ca. 1520, anonymous). It portrays Henry VIII and his entourage of 5,000 winding their way to the Castle of Guiness where the French King Francis I had his headquarters. Henry VIII is portrayed in the outfit depicted in the painting made famous by Holbein the Younger. The king’s distinctive style consists of broad shoulders, barrel-chest, and a prominent codpiece wearing the Renaissance style of slashing. The style entails the simultaneous display of several layers and colors of fabric, giving the impression that the outfit is bejeweled.

[The meeting between Henry VIII of England and Francis I of France was an extravagant event that relied on dress and courtly procession to persuade the courts and noble guests of the power of each of the rulers. Called “The Field of the Cloth of Gold,” the meeting lasted 20 days, during which the kings visited, dined, jousted, and “excelled in theatrical acts of courtesy and friendship,” observed Phyllis Mack (1987, 59). As in other such occasions, this one, too, had spectators, some of which were prostitutes who traditionally followed the troops.

[Although ceremonial robes alter very slowly and are less likely to be affected by fashion changes, they are nevertheless an important source of male pride. In the French court, they made their last impressive appearance at the assembly of all estates called by Louis XVI on May 5, 1789. Men of the nobility wore “magnificent gold—embroidered court dress and hats with flowing plumes” (Batterberry & Batterberry 1977, 192). Until the French Revolution, much of male attire was designed to reflect a man’s access to wealth, prestige, and power.

[American social critic, economist Thorstein Veblen, identified the motivation underlying the pursuit of fanciful attire by men. In *The Theory of the Leisure Class* (1899), he argued that that it was not sufficient to have possession of power and wealth; such ownership must be put on evidence—hence, fashionable attire. Fashionable attire consisted of three essential elements: sumptuous fabrics indicating wealth, garments designed in the latest style, i.e., indicating being in the know; and in a style that informs that so attired, the individual could not possibly engage in physical labor (Veblen 1899, 33-80).

Male members of the aristocracy were also portrayed with armor, swords, gold chains, and jewels.

[Initially, only the husbands’ appearance mattered. But with the increase in wealth, the manner in which wives and children were attired began to matter. To support his claim, a man’s dependents had to dress according to his rank. Veblen (1899, 120-121) characterized the clothing of wives and children as vicarious consumption.

[Male attire was seductive in the sense that it suggested that a man who is well dressed or fashionably attired had access to resources that women need. He could secure appropriate clothes, a roof over their heads, and obtain food for her and their potential children.

### [*Lust and Pride*

[Renaissance dress and Cavalier styles are two fashions where male attire committed both sins, the sin of lust and the sin of pride. Prior to the Renaissance, for over a thousand years, male attire in Europe consisted of a robe (tunic) long or short and a loose-fitting belt. The body and its contours were concealed. In the second half of the 14th century in Italy, older men continued to wear the long robe, but young well-to-do men adopted a style that violated the norm of modesty by adopting sexy and prideful appearance. Male dress hugged the body, exposed the body, and used a variety of color and ornament—the Church’s definition of seductiveness.

[*Renaissance Dress.* Renaissance male dress consisted of a short jacket cut tightly to the body reaching the upper thigh. The sleeves were close fitting and buttoned from the elbow to the wrist. The upper part of the sleeve was tailored in such a way that made it possible to move the arm freely. The short outfit exposed the legs, which were covered in skin-tight hose. Each leg was cut separately and fastened to the inside of the jacket with corded laces somewhat like shoestrings. Calling further attention to the body was the use of two contrasting colors, where the color used on the left leg and left arm matched the right side of the jacket. The right leg and arm matched the left side.

[The hose, which were two separate articles, were supposed to overlap at the top, but often did not. Bending down often meant exposing the buttocks and “what is inside.” This led to much criticism. Around 1370, the two pieces together were sewn in the rear, leaving an opening in the front, which was then covered by a separate triangle of cloth. This addition was transformed into a codpiece—an article of dress celebrating male virility. Renaissance style of dress was modified and worn throughout the Western world.

[The inspiration for the new style was the Greco-Roman tradition that celebrated the virtue of the naked body (Hollander 1978, 83-85). An early version of the *décolleté* can be found in the Snake Goddess of Crete; clinging or transparent draped garments that covered, yet showed off the body, making the female body even more alluring, can be found in the sculptures of the Parthenon.

[*Cavalier Fashion.* Associated with the Dutch, the Cavalier fashion was international in scope. It was worn by King Henry IV of France and King Charles I of England. It was a playful fashion (Batterberry & Batterberry 1977, 132, 138-139). The wire and padding that gave male dress its structure and stiffness were eliminated. The ruff had become smaller and then softer. The dress consisted of a doublet (jacket) where some of its buttons were left unbuttoned. The breeches were left drooping, and the hose allowed to fall untidily around the shoe tops. There was also a big moustache, playful ribbons, sashes, bows, and a flamboyant felt hat sitting precariously on the wearer’s head. The image conveyed the mes-

sage that there were few barriers to male-female interaction (Kybalova, Herbenova, & Lamarova 1968, 177, 180, 183).

### [*Design Approaches to Fashion*

[In his book, *The Psychology of Clothes*, psychologist J. C. Flugel (1966) observed that there are three different orientations to the development of a style. One is where the body itself is of little interest. A profusion of garments are hung on the body. Maximum gorgeousness is achieved by piling one luxurious garment over another in a way that leads to interesting variations in line, and a profusion of glorious colors. Royal robes are an example of this style (Flugel 1966, 156). Layering of fabric was used in the 17th-century portraiture of the nobility by Velasquez, Rubens, and Van Dyck to achieve a sense of sumptuous “nonchalance” appropriate to noble sitters, as Hollander (1978) observes.

[A second orientation is the desire to show the attractive features of the body better. Clothes are used to frame the body. The third orientation involves rendering the body more alluring by using “transparencies and half-concealments” (Flugel 1966, 157). These are garments that reveal the form of the body and give it an additional grace. Flugel (1966, 160) explained that a new female fashion, a period’s desired appearance, can also evolve by emphasizing a new part of the body, or a feature, by treating it as reflecting the spirit of the period. The body part or feature displayed is rendered as “seductively alluring” as a special center of “erotic charm.” In the Middle Ages, for example, the corset was used “to make the breasts inconspicuous.” As the ascetic trend of the Middle Ages diminished, the breasts were brought out of hiding and female fashion focused on the abdomen. Women were portrayed as if pregnant. They also adopted the gait and carriage distinctive of pregnancy. Flugel called this theory “the shifting erogenous zones theory of fashion.” With each new fashion, there is a change in emphasis. The focus is transferred from one part of the body to another. Unfamiliar, the image generates interest. A new erogenous zone had been thus created.

[Another source of fashion was the style of dress adopted by a king’s mistress—a woman who had successfully attracted and kept a king’s attention. Her style became a source of fashion. Madame de Pompadour, the mistress of King Louis XV of France perfected and popularized the robe à la Française to such an extent that it “practically became the French national costume” (Batterberry & Batterberry 1977, 161-165; Kemper 1977, 105-106).

[With little chance for respectable employment, women had to depend on the men in the families for survival. Women until the 1980s had little opportunity to acquire wealth, prestige, and power. Over the centuries, Western European women developed styles of appearance that enabled them to capture male attention. They enhanced their physical appeal, yet remained within the bounds of modesty. Where these images were successful and enabled the woman to attract the attention of the man she wanted, her style was adopted by other women; it became the fashion, and the image became integrated into the vocabulary of images existing in Western culture. Three such images have been identified: adopting elements of male dress, creating an image of harmony, and the glamorous look. These styles are integrated into the vocabulary of images generally available in Western society. In the United States, they were popularized by actresses and fashion designers who searched for a costume to convey the image of a character on the stage, in movies, and in personal appearances.

[A new seductive image was offered by the art and literature of the 1950s. Ballet had acquired new importance after World War II, and designer Clair McCardle offered the bal-

lerina look for everyday attire. The style emphasized long limbs, flat-chestedness, ballet slippers, and hair swept back to reveal a long delicate neck. Embodying these qualities was actress Audrey Hepburn, a former ballet student. She was chosen to play the role of an inexperienced teenager falling in love with a sophisticated older male. She appeared in about 12 movies of the same theme, and in each she conveyed the essence and vulnerability of a new bloom (Rubinstein 2001, 139-150).

[Cultural fascination with adolescent sexuality was reflected in the success of *Lolita*, the novel by Vladimir Nabokov (1954), which was initially banned. Also conveying vulnerability was the partiality of teen and young adult women for their older brother’s or father’s shirt, jacket, or coat. Overwhelming in size, these garments made the young women look smaller and in need of adult care. The vulnerable teenager was decreed seductive in the December 1968 issue of *GQ* magazine. A panel of 30 men psychologists, sociologists, and members of the editorial staff believed it to be one of the basic images American men would enjoy (*GQ* 1968). This cultural atmosphere helped to legitimize a liaison between an older mature male and a romantic teenager. Each of the seductive images emerges in a specific socioemotional context, each with its own impact on the interaction.

### [*Male Attire: Rationality and Self-Restraint*

[With the spread of the puritanical ethos in England in the 19th century, male fashion in England ceased. Calvinism’s strong aversion to the ostentation and etiquette of the courts, as well as to all the luxury and extravagance, were replaced by a demand for thrift (Harvey 1995). A new fashion of sobriety and modesty for both men and women appeared. Male attire became form-following rather than form-fitting, and in “funereal” somber black. It reflected the puritanical ethos for thrift. According to the German sociologist Rene Konig, a man’s suit today is “fundamentally a direct descendant of the puritan dress, a political demonstration against the ostentation of the court” (Konig 1973, 117). Lively colors, the scintillating velvet, and silk fabrics that characterized the clothing of the nobility today can be found in Roman Catholic countries.

[It is a common phenomenon that men in uniforms look seductive. The sizing standards developed during the Civil War made it possible for ready-to-wear military uniforms to reflect rationality and self-restraint. The uniform conveyed to women that, in addition to physical prowess, the soldier was upright and dependable.

[The male suit has continued to offer middle-class women a sense of security. To convey prowess, hip-hop male outfits often include massive gold jewelry around the neck. The fingers are ornamented with heavy rings or with tattoos on each of the fingers.

[Despite positive reviews by the industry, the enterprise of American menswear designer John Bartlett failed, when his artistically designed collection used a variety of colors and was body-hugging, i.e., seductive in the Church’s definition. The male puritanical ethos allows veering only in the direction of affirming social identities.

### [*Spirit of the Period*

[A specific sociocultural context and the attire of celebrities were also a source of seductive images. The aesthetic that characterized the flapper was that of youthfulness (Flugel 1966, 161-162). Visually, the flapper of the 1920s conveyed intensity, energy, and volatility (Sage 1926, 216). Social critics described its impact as leading to a revolution of “morals and manners.” The flapper bobbed her hair, and her dresses were tight, straight, and short, with a low waist

usually placed about the hips. Her chest was flattened, her waist was hidden, and her legs were kept in plain view. Moreover, women frequented the saloons and drank with men, swearing and smoking. They also used contraceptives (Yellis 1969, 46-47).

[The birthrate declined during the Depression of the 1930s, when the fashionable style came from Paris. It was long, lean, and plunging in the back. After World War II, it became patriotic to have children, and Dior's 1947 "New Look" was transformed into the "pregnant look" and "the sack" look. These styles concealed the pregnancy. The art of dress gave in to the miniskirt in the 1960s. The miniskirt is youthful in feeling and allowed freedom of movement.

[The 1980s—the era characterized by the pursuit of wealth and conspicuous consumption—was an era of too many stretch limousines, too many yachts off Newport Beach, and too many fur coats in Aspen (Phillips 1990). To better convey the image of success, American businessmen flew to England to buy 'bespoke' suits—a dark suit made to order by English tailors. The realm of black had continued to spread. Moreover, the tailoring industry in England shifted emphasis from the ostentatious, body-hugging attire the dandies wore, to a form-following suit in dark funereal color announcing self-restraint. President Reagan, on the other hand, also had a custom-made suit, but he had his made in Los Angeles, the movie capital. It was made from specially woven yarn in earth-tone colors. Being an actor, he was aware that a color of cloth that complements one's skin tone enhances appearance and encourages affective response.

[Production of women's fashions in France emanated from the need to provide skilled women with work. The revolutions of the 19th century had disrupted the economy and left many women unemployed and their children hungry. According to Charles Frederick Worth, Empress Eugenie's couturier, the king had asked him to create a new fashion with each new season. Everything his wife wore was immediately copied, first by the upper class and then it filtered to the lower classes. To make sure that members of the upper class did spend their money on new clothes, he instituted the practice that those wishing to appear before him must be dressed in the latest fashion. France became the center of fashion.

[In the United States of the 1960s and 1970s, informality and youthfulness characterized female fashion. Fashion in the Reagan White House (in the 1980s) had become increasingly form-fitting, slinky, and slithering, accentuating female curves, and expensive. It was based on what Flugel described as "the interplay of concealment and half-transparencies." Exposed backs, low necklines, side and front slits, and the pouf were expected to create sexual allure (Rubinstein 2001, 299). Nancy Reagan's delight in clothes, balanced for color and ornament, extravagant and luxurious, was consistently reported in the news. The fashion reflected the spirit of the 1980s—glorification of capitalism, free markets, and finance (Cannon 1990). In 1985, looking rich was very important. Television programs focused on the real and imagined lives of wealthy people, such as *Lifestyles of the Rich and Famous*, *Dallas*, and *Dynasty*, which were enormously popular with the American public.

[The fashion during the Clinton presidency was for the young. There were skirts that looked like flimsy silk half-slips, shoes styled like bedroom slippers, body-hugging pants made of snakeskins and with wild-animal prints. Harking back to the Garden of Eden and the jungle, this fashion suggested sexual temptation and danger.

[Soon after George W. Bush assumed the presidency, snakeskin pants, bags, and jackets disappeared. The young continue to wear their low-riding pants (where the naval is

exposed). Also exposed are the feet. Flip-flops, footwear traditionally worn around the swimming pool to prevent slipping or on the beach as protection from the hot sand, had become fashionable and were called "toe cleavage" by Guy Trebay of *The New York Times* (June 17, 2003). Flip-flops are the simplest of all footwear—two scraps of leather or cloth. With little structure, they are the cheapest to produce and most affordable, but offer the foot little support. Clothes, too, offered little support. Schoolgirls' jumpers, miniskirts, and tops were offered in bold color combinations, or a prairie skirt with a nipped Victorian jacket, tattered jeans with rosebud-striped silk jacket, and a denim dress dripping with cowry or puka shells worn for good luck by indigenous groups. Spring/Summer 2003 outfits could be asymmetrically hemmed, spliced, or bisected, *The New York Times* accurately predicted (September 22, 2002). The jewelry in fashion consisted of two styles, one with earrings worn close to the ear, the other dangling downward, as if the wearer hoped to reach the forces underlying the universe for nurturing, support, and protection.

[*American Popular Culture*. Hip-hop attire increases the size of the individual and says, "I am here, you can't ignore me." The trendy jeans have strategically placed faux-faded stripes that direct the observer's gaze towards the genitals. The young know the look they want and they search for it. Finding the right style was about "being yourself."

[The essence of pride and lust are also conjured in fantasy images. These images reflect what societal gatekeepers think women want from men and what they think men want from women.

[*What Women Want from Men*. In the figure of Superman, the bespectacled mild-mannered newspaper reporter, Clark Kent, was invulnerable to the forces of evil once he changed into a Superman costume. He saved women and destroyed criminals. He, however, was unable to connect to his beloved Lois Lane (Kimmel 1996, 211-212). Another fantasy hero was the cynical, dangerous, hard-boiled detective—a central character in film noir. He was depicted as a man who made the world safe for women and children. He was sexually alluring, but unavailable for marriage (Savage 1998). Perhaps the most famous reflection on what men want from women was a statement made by the actor Humphrey Bogart in June 1945, "I'm tough and intend to stay that way."

[*What Men Want from Women*. The "bombshell" and the "pinup" were two distinct images that men had created. The term *bombshell* first emerged in the 1930s during the Depression. The name referred to big-bosomed women who worked outside the home and were economically and socially emancipated (E. T. May 1988). Images of pinup girls accompanied men through the depth of the Depression, the battlefields of World War II, and the war in Korea. *Esquire Magazine* viewed female sexuality as an inspiration to American fighting men. Artist Alberto Vargas and George Petty were commissioned to depict images of ideal females that came to be known as "pinup girls." The images consisted of curvaceous young women in skintight short shorts. Among those posing were famous actresses: Marilyn Monroe, Betty Grable, and Rita Hayworth. Military men used pinups to adorn their vehicles, noses of bombers, and anything else they could (Christian 1998).

[In conclusion, the dichotomies of Male/Female and Lust/Pride established by Christianity were intellectual constructs that became 'a taken for granted' social reality. They underlie the organization of society, patterns of interaction and social life congruent with these social constructs. For some, these social distinctions may have been

false, resulting in the closing of the possibility of patterns of interaction and expressions of emotion that enhanced societal development and personal growth. The direction that American fashion takes as we enter the new world concerned with international strife and war is likely to reflect these new realities in much the same way. (*End of update by R. P. Rubinstein, in memory of Paul Shapiro, Ph.D.*)

### [Concluding Remarks

#### [Change, Diversity, and Conflict: Points and Counterpoints

DAVID L. WEIS

[*Update 1998*: In the beginning of this chapter, we identified the assessment of how change occurs in a context of conflict between diverse social groups as a major theme in our analysis of sexual behaviors and values in the United States. Subsequent pages are rich in details relating to this theme. The reader is encouraged to savor the entire chapter and digest all of these details. However, we would like to conclude by recapitulating and integrating some of the major points related to this theme.

#### [Change

[Over a quarter of a billion Americans, representing a wide variety of ethnic, racial, and religious traditions, continue to struggle with the interface of science, technology, and society in all domains of life, nowhere less or more intimately than in our sexual behaviors and values. Recent computerized technology has enabled us to produce, access, and consume more information than has ever been possible in the history of the world. As we noted elsewhere, professionals and the public can now turn to the Internet, rather than to more traditional sources, to obtain sexual information, receive counseling, and even interact sexually. This provides many redundant opportunities. For example, persons who have felt alienated and isolated from the sexual “mainstream,” such as the physically disabled and transgendered, have found information, support, and a new medium for self-expression on the Net. Yet, the use of this technology is not without conflict. The war over censorship versus freedom of speech and self-expression, waged with other print and broadcast media, is continuing with renewed fervor as state-of-the-art technology tests the limits of access to sexual information and sexually explicit dialogues and materials.

[As we have seen in every aspect of our sexuality examined in these pages, numerous changes are taking place in Americans’ collective and individual sexual lives. As Weis described in “Demographic Challenges” at the beginning of the chapter, various factors are having an impact on the experience of sexuality: the changing racial/ethnic fabric; the “graying” of America; and more-varied lifestyle patterns (e.g., increases in wives/mothers working outside of the home and in the number of cohabiting couples, and a growing disconnection between childrearing and married life).

[Yet, the public representation and institutionalized values of American sexuality are often not keeping pace with the realities of people’s private lives. For example, it is well documented that television, considered the most influential medium in American life, continues to present stereotypical views of gender roles, which do not reflect the realities of people’s personal, family, sexual, and work lives. As Weis noted in Section 8 on unconventional sexual behaviors, while heterosexual marriage is the modal pattern for sexual relations in the United States, sizable percentages of Americans depart from this assumed norm to engage in nonmarital sexual expressions, including premarital, extramarital, same-gender, and unconventional sexual behaviors and relationships. Contrary to the goals of most public policies and programs dealing with adolescent sexuality, the

facts demonstrate that “premarital virginity” has largely disappeared in the United States.

[Because change is actually a constant within people’s sexual lives on both the individual and societal levels, research must focus more on the process and dynamics of sexuality rather than simply recording “social bookkeeping.” More-varied and complex qualitative and quantitative research methodologies and analyses must be applied to the study of human sexuality.

#### [Diversity

[The theme of diversity is woven throughout every thread of sexual life within the United States. Our country is known for being a “salad bowl” of diversity with a continuous struggle to achieve its promise of human rights—no matter one’s gender, racial/ethnic background, socioeconomic status, religious persuasion, or physical characteristics.

[Much of our public and scholarly discourse about sexuality still relies heavily on simplistic, often dichotomous, categorizations for complex phenomena, such as gender, race, ethnicity, and sexual orientation. However, the sexologists who contributed to this book have tried to expose perspectives and research supporting the complexity of personal characteristics as they interface with sexual expression. Although this was not always possible, since scholarly research and information about diversity and sexuality tend to be limited, it is important to note the many aspects of diversity that are treated in some detail. The complexity of gender (Section 7) is evident in the paradigms of the “gender rainbow” (Leah Schaefer and Constance Wheeler), “gender flavors” (June Reinisch), “gender landscapes” (James Weinrich), and the identification of five sexes (Anne Fausto-Sterling). Samuels, and Pérez and Pinzón-Pérez (Section 2B) emphasize the varied characteristics and cultures of those labeled “African-Americans” or “Latinos,” and the effects of these upon individuals’ sexuality. Koch (Section 2B) dispels the myth of “the feminist” representing a monolithic ideology. Francoeur and Perper (Section 2A) explore the varieties and complexities of fixed and processual religious groups, a diversity highlighted by Forrest’s (Section 2A) discussion of the sexual values found among members of the Church of Jesus Christ of Latter-Day Saints, or Mormons. The work of Kinsey, Klein, Weinberg, Williams, Pryor, and Moses and Hawkins, among many others, illuminates the diversity among homosexually and bisexually oriented people (Section 6). In discussing adult heterosexualities, Weis (Section 5) describes the varieties of sexual expression and relationships among married and nonmarried individuals. Francoeur and Koch (Section 8B) describe the diversity among sex workers, while Love (Section 8D) points out that the United States has more fetish clubs than any other country in the world, and discusses some common and unique fetishes. These are but a few examples of how every aspect of sexuality is reflective of and affected by diversity. It is obvious that a major challenge to American thinking about sexuality requires that we stop viewing sexuality in simplistic terms of male or female, black or white, gay or straight, marital or nonmarital, or normal or abnormal.

[We still have great strides to make in closing the gaps in our knowledge and understanding of how sexuality is affected by and reflective of diversity. The majority of past and current research does not conceptualize or operationalize many personal and social variables as multidimensional (e.g., gender, race, and sexual orientation)—when they are addressed at all. Koch’s 1997 study of the 12 quantitative research articles published in *The Journal of Sex Research* in 1996 reveals, for example, that the race/ethnicity of the

subjects is not reported in two thirds of the studies. For the other third of the studies, no statistical analyses are presented to examine similarities or differences, based on race/ethnicity, in the sexual topics being examined. Similarly, in half of the 12 quantitative studies, the sexual orientation of the subjects was not reported. In the one study that identified the subjects' sexual orientation, no analyses of similarities or differences, based on sexual orientation, was conducted on the independent variables under study. None of the research examined the interaction among variables such as gender, race/ethnicity, and sexual orientation. As we have repeatedly seen throughout this book, these interactions are paramount for an accurate and realistic understanding of human sexuality. The sexual experiences of Anglo-American heterosexual men often differ from those of Anglo-American heterosexual women, which also differ from those of Anglo-American gay men, which also differ from those of African-American gay men, which also differ from those of African-American lesbians, which also differ from those of Latina lesbians, and so on. Our research sensibilities and methodologies must become more sensitive and sophisticated if we are to truly advance sexual science, education, therapy, and policy.

[Without adequate research, and sometimes even with it, people rely on stereotypes to form personal opinions and public policy. Too often these stereotypes lead to adverse judgments or prejudices. These prejudices then influence individual and collective actions, resulting in discrimination against underrepresented groups. This text was filled with examples of discrimination affecting people's sexual relationships, sexual health, and sexual rights. For example, women of lower socioeconomic status in the U.S.A. have much more restricted access to legalized abortion services than do women of higher economic status. Individuals from marginalized groups are disproportionately affected by sexually transmissible diseases, including HIV disease, because of poverty and poorer education and healthcare. Gay men and lesbian women are the last large minority group in the U.S.A. that generally has no legal protections against discrimination. They are subjected to discrimination in all areas of their lives: housing, employment, healthcare, relationship and family formation, and military service, as well as being targets of gay bashing and other hate crimes. Sexual scientists, researchers, educators, and other professionals, as well as citizens at large, must take action to stop ignorance and prejudicial attitudes from continuing to shape public policy, resulting in harm to people's health and well-being.

#### [Conflict

[With the advancements in science and technology, the diverse groups in our society have not been able to keep abreast by implementing concomitant social progress. It seems that the more things change, the more they stay the same. As described in the section on "Contraception, Abortion, and Population Planning," abortion, especially until "quickening," was widely practiced throughout the history of the United States until the second half of the 19th century. At that time, various factions of "social purity" groups banded together with branches of government to restrict sexual freedoms and control reproduction. Laws, including the "Comstock Law," began to alter 200 years of American custom and public policy towards contraception and abortion. The anticontraceptive provisions of the Comstock Law were enforced until 1936, when finally a federal appeals court overturned them based on the medical authorities who supported the safety and reliability of contraception.

[Following are examples that illustrate the "point" and "counterpoint" of sexual conflicts in the United States.

#### [Points

- Today, we are experiencing a well-organized and often successful resurgence of the social purity movement, which is restricting sexuality education, sexual health, sexual research, and many sexual freedoms. For example, there are currently more barriers to U.S. women's access to abortion than since the Supreme Court's 1973 *Roe v. Wade* decision. The moral issues of groups of religious and political conservatives are more influential in determining legislated public policy than the well-researched and documented public health concerns surrounding non-access to legalized abortion. New "Comstock laws" are being enacted that once again restrict access to birth control information and services, even though the weight of the authority of the medical world supports their safety, reliability, and necessity.
- Federal funding of abstinence-only education is another example of policy and practice being driven by special interest groups' concern with moral issues rather than by knowledge gained through experience and research. Abstinence-only education has been shown, both nationally and worldwide, to be less effective in preventing unintended pregnancy and sexually transmissible disease risk than more-comprehensive forms of sexuality education. Yet, some effective sexuality education programs are being replaced throughout the country with the less-than-effective abstinence-only ones. At the same time that a nationwide study of puberty documents that half of America's black girls and one in five white girls has begun puberty by age 8 (the 3rd grade), school boards, administrators, and parents are abandoning sexuality education or postponing it until junior or senior high school, even in states with sex education mandates.
- In addition, our knowledge of normative sexual development throughout the lifespan, particularly in childhood and adolescence, is severely hampered by lack of funding and other barriers established by conservative "social purity" groups that wield power through federal, state, and local governments. Funding for sexuality research by well-respected scientists, like Udry and Laumann, has been blocked, despite the fact that such research is critical to expanding our basic knowledge of sexual development, practices, and relationships, as well as reducing sexual health risks, including HIV disease.

#### [Counterpoints

- Despite long-term opposition of some groups to contraception and abortion—the Comstock Laws, arrests of Margaret Sanger for distributing birth control, opposition of the Popes to "artificial" birth control, and the recent successes of the "pro-life" movement to restrict access to abortion—the general trend over the course of the 20th century has been a greater ability of women and couples to control their fertility and greater use of a variety of family planning practices.
- Despite a century of efforts by various adult groups to limit adolescent premarital sexual behavior, the clear trend of the 20th century has been increasing percentages of adolescents engaging in premarital sexual practices at progressively earlier ages. By the 1990s, fewer than 10% of American youth are virgins on their wedding day. Attitudes have also become progressively more permissive.
- Despite the efforts of some groups to restrict the availability of sexual information and to block sex education

in the schools (again, a century-long effort), the general trend has been toward more sex education in the schools and greater availability of information through a number of sources, particularly various media. Nevertheless, conservative members of the Senate and House of Representatives did pass a bill limiting sexual information on the Internet; however, the Supreme Court ruled the law unconstitutional.

- Although many sexual issues remain controversial, discourse about sex has become freer and more open. More people talk about sex in public settings and discuss a wider variety of sexual practices than in the past. For example, public discussions of homosexuality are much more common now; and everyone seems to be talking about oral sex in the wake of the sexual allegations against former President Clinton. There is also more sexual content on American television, both on the networks and cable; in movies, including in the theaters and on videocassettes; in all forms of printed material, such as general-circulation and sexually explicit magazines; and in all forms of popular music, from heavy metal and rap to country music.
- Homosexuality has become increasingly visible. The “coming out” of Ellen in a television sitcom series of that name is one example of this greater visibility. In addition to Ellen, there are more gay characters being portrayed on American television and in movies than ever before. There is also a growing availability of gay-related fiction. Disney and other corporations have begun to extend job benefits to gay couples, although conservative groups threatened to boycott Disney because of this. Hawaii is considering some kind of legal recognition of homosexual unions or marriage, although other states have stated that they will refuse to legally recognize such unions. Even the U.S. Supreme Court has ruled that same-gender sexual harassment does exist. However, gays still have not been granted full equality in the U.S. and face continuing challenges to their civil rights.
- Finally, the rising age at marriage and the growing divorce rate throughout the 20th century have increased the relative percentage of unmarried adults, at any one time, who are pursuing various nonmarital lifestyles and relationships. There seems to be greater awareness of this trend and acceptance of this trend in adult sexual expression.

[Some of the obstacles we face in better understanding American sexual values and behavior originate and work within the scientific community itself. Scientists from various disciplines must learn to work together in a more collaborative fashion to examine the various contributing factors and outcomes of specific sexual development, health, and educational issues. Competition between biological, psychological, and sociocultural research perspectives and practices needs to be minimized and a more holistic biopsychosocial perspective adopted.

[As we begin the 21st century, the historical theme of sexuality being embedded in change, occurring within a context of conflict among diverse social groups in the United States, will certainly continue. The spheres of influence of various social groups will ebb and flow with changing demographics and social consciousness. The dimensions of change will be directly affected by the speed and direction of technological development. As in the past, persons with fixed-world ideological views will continue to try to impede social progress in adapting to change and diversity. Yet, on balance, the trend throughout American history has been towards liberalization in sexual attitudes and behaviors. It is

our belief that education, research, and human rights will continue to be critically needed guideposts in the determination of sexual values, practices, policies, and programs in the United States in the future. (End of update by D. L. Weis)]

### [An American “Call to Action” to Promote Sexual Health and Responsible Sexual Behavior

ROBERT T. FRANCOEUR and RAYMOND J. NOONAN,  
with CHRISTIAN J. THRASHER.

[Update 2003: About 60 experts in various facets of sexuality in America worked with us and with David L. Weis and Patricia Barthalow Koch, our knowledgeable coeditors on this chapter, to develop this extensive examination of sexuality in the United States. We cannot speak for our contributors. We also decided not to speak for ourselves as editors. But we want to have a brief statement and summary to bring the many pieces of this American mosaic together.

[We could find no better working statement to express the underlying message of this survey of American sexual attitudes and behaviors than the “Call to Action” issued in 2001 by David Satcher, M.D., Ph.D., the 16th Surgeon General of the United States. In the last year of his appointment by President Bill Clinton as Surgeon General, Dr. Satcher committed himself and the U.S. Department of Health and Human Services to community-based research studies that linked together the sexual health of Americans with responsible sexual behavior. In 2001, as he left office and President George W. Bush entered the White House, Dr. Satcher’s *Surgeon General’s Call to Action to Promote Sexual Health and Responsible Sexual Behavior* was released. The *Call to Action* was developed through a collaborative process. Its content was based on the strongest science ascertained with broad input from a diverse spectrum of health professionals, academics, policymakers, parents, teachers, clergy, social service workers, and social movement representatives. The *Call to Action* utilized public and private platforms to raise awareness about health problems related to human sexuality and their effects on all Americans, especially the economically disadvantaged, racial and ethnic minorities, persons with different sexual identities and orientations, disabled persons, and adolescents, as well as persons of all ages and backgrounds.

[The overall goal of the *Call to Action* was, and is, to open up and facilitate a mature, respectful, honest, and thoughtful discussion about sexuality. As a country, Americans must understand that sexuality encompasses more than sexual behavior, sometimes referred to as the “-uality” of sexuality. Sexuality has many aspects beyond the physical ones that we are saturated with everyday in this country. Sexuality is a fundamental part of human life.

[With Ford Foundation support, Dr. Satcher and the National Center for Primary Care at Morehouse School of Medicine in Atlanta, Georgia, are working to develop a strategy for improving sexual health, as well as increasing public discourse about human sexuality in the United States using The *Call to Action* as a framework. A National Advisory Committee has been formed with leaders from many different disciplines within the field of sexuality to guide these domestic efforts in furthering the *Call to Action*.

[Sexuality is an integral part of human life. It carries the awesome potential to create new life. It can foster intimacy and bonding as well as shared pleasure in relationships. Yet, it can have negative aspects, including sexually transmitted infections, HIV/AIDS, unintended pregnancy, and coercive or violent behavior. These result from America’s inability to deal appropriately with human sexuality, an inability we share with many other nations of the world. All individuals

and communities share important responsibilities for sexual health. These include assurance of access to culturally and developmentally appropriate comprehensive sexuality education and sexual and reproductive healthcare and counseling; the need to make informed sexual and reproductive choices; the need for respect for diversity; and freedom from stigmatization and violence on the basis of gender, race, ethnicity, religion, or sexual orientation.

[In the words of Dr. David Satcher,

Finding common ground might not be easy, but it is possible. The process leading to this *Call to Action* has already shown that persons with very different views can come together and discuss difficult issues and find broad areas of agreement. Approaches and solutions might be complex, but we do have evidence of success. We need to appreciate the diversity of our culture, engage in mature, thoughtful and respectful discussion, be informed by the science that is available to us, and invest in continued research. This is a call to action. Americans cannot remain complacent. Doing nothing is unacceptable. Our efforts will not only have an impact on the current health status of our citizens; they will lay a foundation for a healthier society in the future. (End of update by R. T. Francoeur and R. J. Noonan)]

### [Epilogue: A Transcultural Inventory of Courtship and Mating

JOHN MONEY\*

[Editors' Note: John Money, Ph.D., is considered by many sexologists as the most important theoretical sexologist of the 20th century, offering many insights and connections across the many disciplines that make up sexology and sexosophy, the philosophical underpinnings of sexual beliefs and practices. While reading his contribution, consider how the many aspects of sexuality covered in this chapter might fit together as a unified whole within the rubric of Money's characterizations. Given that the United States is a multicultural nation derived from many other nations, these concepts can help to explain the origins of the various attitudes, beliefs, and behaviors described in this chapter, which did not develop overnight. It will be more difficult, however, to resolve some of the conflicts that might have been predicted by his synthesis, yet it might ultimately help to resolve some of the conflicts by providing better understanding of the commonalities that exist among all Americans, as well as among all human beings; thus, they can be applied to all of the countries in this *Encyclopedia*. Of primary importance, perhaps, is that Money's synthesis includes the importance of both the mind and the body together, hence his well-known criticism of the false dichotomy of pure essentialist and social-constructionist adherents. Although some of his theses remain controversial, perhaps his synthesis, together with our "Call to Action" in the previous section, might help us to sort out those attributes that are culturally dysfunctional in the modern world, eventually leading to a sane sexual society that benefits everyone.

### [Evolutionary Derobotization

[Update 2003: Around the world, people who share a common heritage include in that heritage explanations and legends, among others, of creation, life in the hereafter, and procreation. The action patterns of courtship and mating exist synchronously as maps in the brain and its nervous system and in the mind. They are robotic in apes and in monkeys and

even more so in four-legged mammals than they are in our own human species. Robotism of an action pattern of courtship and mating means that it is highly replicative or stereotyped from one occasion to the next and from one partner to another. By contrast, a nonrobotic action pattern of courtship and mating is developmentally more subject to individual idiosyncrasy and to community doctrine. The term, *lovemap* (Money 1986, 1999), is the overall term that I coined for the concept of the action pattern of courtship and mating, the wide diversity and underlying universals of which can be found in the pages of this chapter and throughout the *Encyclopedia*. The lovemap includes ideation, imagery, and practices, i.e., the way we form our ideas and imagery relating to sex and the way we develop our behavioral practices.

[In the absence of replicable experimental evolutionary data, one must be satisfied with conjecture. It is my conjecture that derobotization of the prototypic human lovemap was part of a more widespread derobotization of action patterns once phylogenically mapped in the human brain; and that derobotization was the price to pay, so to speak, for the evolutionary emancipation of the human language map (speechmap) from a robotic system of hoots and howls into a system of syntactical reasoning, symbolic logic, and mathematical calculation.

### [Ten Constants of Sexual Doctrines

[Doctrines of courtship and mating differ from one community to another, to a greater or lesser degree, on the basis of ten constants: progeny, age, morphology, gender, pedigree, caste or class, number, duration, privacy, and accessories. The annotations that follows apply predominantly, though not exclusively, to the doctrine of sexuality in Christendom.

[1. *Progeny*: Singly or severally, the action patterns of human courtship and mating are both recreational and procreational. As a species, we have, however, been bio-engineered to procreate dieciously, that is by the union of male and female, and not parthenogenically. Diecious procreation is the pivotal constant around which devolve the other constants of our courtship and mating doctrine. Until very recent times, failure to procreate was considered grounds for annulment of a marriage and was attributed to barrenness of the female, not to sterility or impotence of the male partner. Arguments about contraception is a recent phenomenon. For most of human history, predictably effective contraception did not exist. Having progeny implies also the provision of family and community care of the offspring.

[2. *Age*: Procreatively, it makes sense that age matching should prevail over age mismatching in social doctrines of courtship and mating. In the system of arranged marriages, however, an infant or child may be betrothed to an adult partner, but without copulation until the age of maturity. The age of the end of childhood may be arbitrarily legislated to extend from the onset to the end of adolescence. Thus, a young adult man or woman who has sex with, say, a 17-year-old may be charged in one culture with sexual child abuse. At the older extreme of the age scale, in another culture, an adult of 60 who has sex with a 25-year-old may be envied or ridiculed, but not accused of sexual abuse. In the juvenile years, age-matched sexual rehearsal play that is positively endorsed in the ideology of one society is prohibited and abusively penalized in another.

[3. *Morphology*: Chronological age and morphological age are not necessarily in perfect agreement. When they disagree, morphological age is given precedence. Take the example of a pubertally precocious boy who, by age 6 has the mature morphological development, although short in

\*Supported by the National Institute of Child Health and Human Development, Department of Health and Human Services, Grant #R25-HD00325-46.

stature, of advanced teenage. He is misconstrued by strangers as a socially retarded teenager, not a socially advanced juvenile. Conversely, a morphologically retarded hypopituitary-dwarfed girl aged 19 is misconstrued as a prepubertal child presenting herself as a young adult woman. In uncounted ways, our morphology is also our destiny.

[4. *Gender*: As members of a deicious species, we come to expect of our fellow human beings that their morphology and appearance will be concordant with the action patterns of their courtship and mating. Historically and transculturally, however, there are examples of communities that have not only tolerated, but idealized male/female bipotentiality—the other sex for procreation and the same sex for playfulness. Homosexuality and heterosexuality in ideation, imagery, and practice, may be concurrent, or they may occur sequentially. Each may be fixated and may exclude the other, but exclusive homosexuality has not occurred with a sufficiently high incidence to slow the population explosion of the human species. Contemporary technology that permits ascertainment of the sex of a fetus and its abortion only if it is female has already changed the sex ratio at birth in some parts of the world in favor of an excess of boys. For them, subsequently, there are too few age-matched females for traditional family formation. People with a fixation on sex reassignment nowadays call themselves transgendered (not transvestite or transsexual as formerly). Diagnostically, they are classified as having a gender-identity disorder whereas, more accurately, they have primarily a body-image disorder.

[5. *Pedigree*: Human beings are designed phylogenically to live in troops and to be troop bonded. To the extent that they are members of the same family of birth, they share genes in common. Alternatively, they may be totemic kin by assignment. Either way, if a couple has the correct totemic pedigree relationship, they may be obliged to procreate and, if not, forbidden to do so. Thus, whereas first-cousin marriages may be the ideal in one culture, they may be prohibited as incest in another. Keeping track of the totemic pedigree of an entire community may have constituted a major deployment of the human intellect in ancient times, as it continues to do among Aboriginal elders of Australia's Arnhem Land today (Money et al. 1970).

[6. *Caste and class*: Our primate heritage dictates not only that we are a troop-bonding species, but also a species that recognizes a hierarchy of authority and leadership within the troop. Thus, a community's code of courtship and mating specifies matching of procreating couples on the criteria of caste, class, title, race, religion, language, wealth, or some other special criterion. A partnership that is legally miscegenation and an abomination in one community may be idealized or romanticized as a source of power and privilege in another.

[7. *Number*: As well as being troopbonders, human beings are pairbonders. The action pattern of neonatal nutritional bonding are, in part, prototypes of those that will later come into play as action patterns of procreative pair bonding. At its most intense, this kind of bonding is known as limerence or as being lovesmitten or lovestruck. Limerence is typically for one partner at a time, but there may be more than one partner, if not concurrently then sequentially; and partners may be either matched or mismatched on the criterion of social class, caste, age, or fidelity.

[8. *Duration*: Single or multiple partnerships each may be either transient or long-lasting. As is the case in some bird species, monogamous fidelity that appears to be lifelong, may actually apply to lifelong pairing for parenthood (nest building, incubation, and feeding of the young, season after season), and not with respect to copulation. The proof

lies in DNA testing of each generation. A doctrine that specifies monogamy as the ideal may persecute nonconformists, or it may tolerate separation and divorce, or turn a blind eye to an affair—a system within a system. Duration covers any length of time, from a hurried lunchtime assignation to the anonymity of a one-night stand, to a “seven-year-itch” marriage, or to a love affair in limerent perpetuity. The youngest age for the onset of a long-lasting love affair (Money 1997, 122) is as early as age 8, if not earlier. Worldwide, juvenile sexual rehearsal play is condemned more often than it is condoned or imbedded in social doctrines of sexuality. Illegitimate grandparenthood is an economic issue as well as an issue of morality.

[9. *Privacy*: One arrives naked on this planet, and it takes not weeks or months, but years of exposure to the sexual taboo to develop a full sense of shame or guilt about exposing the naked sex organs and their action patterns. A taboo imposes a negative sanction on an action pattern normally manifested in the course of human development, for example, the taboo on eating certain foods, on talking to members of certain kinship groups, or offending ancestral spirits. The taboo on sex is particularly effective, as it is nonlethal, but is subject to some degree of on/off regulation. Its function in society, when instilled at a very young age, is that thenceforth, the very threat of its sanctions calls forth obedience. Thus a taboo is a political weapon. Its presence is a temptation to some to rebel against it, which is precisely what happened in the 1960s and 1970s, the era of the sexual revolution in Western civilization. We still live in the era of the counterrevolution. The privacy rule is total when it applies to any public manifestation of courtship and mating, including kissing. Not only genital eroticism, but also genital exposure for a gynecological examination may be subject to taboo. In the electronic or print media, depiction of the genitalia and their action patterns may be prosecuted as obscene and pornographic. Indeed, pornography may be defined as that which is explicitly seen or heard in public when a doctrine's privacy rule regarding sexual pairing is disregarded. By the same token, multipartnered sex, as in group-sex parties, is outlawed, except for the infrequent celebration of ceremonial carnivals or bacchanals. Under conditions of severely crowded family living, the scarcity of auditory and visual privacy interferes with intimacy in courtship and mating. Likewise, the scarcity of privacy interferes with diagnostic and prognostic observation and recording of data at first hand in couples with a complaint of sexual malfunction. The privacy rule skews data on the prevalence of genital adornment by piercing, tattoo, or scarification—and likewise data on genital mutilation as a sequel to clitoral or penile circumcision.

[10. *Accessories*: Copulatory toys include vibrators, dildos, butt plugs, cock rings or straps, and various paraphernalia specific to selective paraphilic lovemaps, notably those in the category of sadomasochism or of bondage and discipline. The copulatory accessory that is by no means a toy, however, but a pregnancy planner or preventer, is the contraceptive device or substance. Contraceptives range from the condom and the intrauterine device (IUD), to the hormonal Pill or patch. In the public forum, contraception arouses the same strong passions as do abortion and sterilization as methods of replacing procreational sex with recreational sex. There is no accessory, either medicinal or mechanical, that offers complete prophylaxis against the lethal human immunodeficiency virus (HIV), which is the agent of acquired immune deficiency syndrome (AIDS). As of the year 2003, HIV faced a challenge for lethality, namely the corona virus that is the agent of severe acute respiratory syndrome (SARS). SARS may be spread by, *inter alia*, sexual contact, whereas

HIV is spread predominantly by that route. Other sexually transmitted diseases (STD), though of great individual and public health concern, are not inexorably deadly.

### [Phylism Theory

[There are no passes or failures generated by the ten constants of a doctrine of courtship and mating, for they do not constitute a test but rather an agenda. They are applicable to the systematic gathering and inventorying of data pertaining to the sexual ideation, imagery, and practice of a single individual or of an entire community. A doctrine's propositions may be highly consistent with one another or chaotically inconsistent and contradictory. A doctrine, no matter how self-contradictory, must first be recorded nonjudgmentally before judgment can be passed.

[The ten constants have their origin in logical analysis of such philosophical antitheses as are represented in teleological versus mechanistic, hereditary versus acquired, organic versus intrapsychic, or nature versus nurture. My own position on all of these antitheses is that each of the pair needs the other, without which there is a void. The contribution of each needs to be established, not by proclamation, but empirically, step by laborious step. The bits and pieces of the building blocks of the ten constants of ideation, imagery, and practices of human sexuality I like to call *phylisms*. That means they belong to all of us collectively and phylogenically as members of our species—for example, the transcendental experience of orgasmic climax. The metaphorical buildings made from phylismic building blocks are ontogenic. They embody individual history, which may or may not be shared by other people.

[Phylism theory is an outgrowth of imprinting theory: At a critical or sensitive stage of development, there is a threefold confluence of an innate recognition mechanism, an innate releasing mechanism, and an innate response mechanism. The classic example is that of a newly hatched duckling that recognizes a moving squat-shaped thing (usually, of course, the mother duck), which in turn triggers an innate releasing mechanism, which in turn releases the actual response of following the squat-shaped moving thing. The long-term outcome is that following the moving thing, even if it is a waddling human being, becomes fixated (think native language) for a prolonged period of time (see below under paraphilias).

### [Phylisms of Courtship

[Remnants of our robotic past can be observed when two people are mutually attracted and make a move on each other. Whether in an urban club or park, or in a tribal rainforest, the action patterns are similar regardless of individual, ontogenic embellishments. Much abbreviated, they are as follows (based on Givens 1983; Perper 1985; Eibl-Eibesfeldt 1985; Money 1998, Ch. 1): eye contact, stare, blush, gaze averted, eyelids droop, gaze again, squint, smile, vocal animation, breathiness, louder voice, silly laughter, mutual rotation, move closer, wet lips, adjust clothing to uncover skin, inadvertent touch, mirror gestures, synchronize movements, hold hands, pat, embrace, kiss and fondle with accelerated heart rate and breathing, sweating, genital secretions, dry mouth, and butterflies in the stomach. Although not inevitable, copulation ensues.

[The courtship responses of men and women are not identical but complementary to one another, as they are in the act of procreative copulation. Women on the whole are more dependent on contractive (touch) than on visual stimuli for the arousal and maintenance of erotic responsiveness. Contractation applies to tactile or dactylic (fingering and fondling) senses. Women are not erotically unrespon-

sive to the visual image of sexuality nor are men unresponsive to contractive stimuli. The difference between men and women is not absolute, but a matter of proportion. Men are aroused at a distance not by smell, as is typical in other mammalian species, but by what the eyes see. From an evolutionary perspective, it may well be that human male eroticism is a spinoff from bipedal locomotion. Derobotized, we meet one another eye to eye, vertically, in a sexual encounter, whereas four-legged mammals meet one another horizontally, rump end to snout end, in a robotized sexual encounter. Thus, bipedal locomotion may have been an evolutionary forerunner of derobotization of both the lovemap and the speechmap (see above) in us human beings.

[The male-female difference in the ratio of visual to contractive sexuality is entrenched in the doctrine of sexual orthodoxy in Christendom. Since we live in the era of the globalization of goods and services, our sexual doctrine becomes globalized also. Thus, the sexuality of tribal peoples in remote places becomes observed and recorded by people whose own doctrines are Westernized and judgmental. Observers condemn and neglect that which they study while they are studying it. Until the very recent past, for example, official ethnology did not accept the idea that falling in love was scientifically suitable for study in tribal peoples.

[It is commonly avowed that contractive sexuality is superior to concupiscent sexuality. The former, it is claimed, is more romantic and spiritual, and ostensibly less carnal and animalistic than concupiscent sexuality (Money 2003). It is love, not lust. Too much or too little of either type, however, can give cause for clinical concern. It can give cause also for political concern by reason of linking politically correct sexuality to romantic sex and to women only. Politically incorrect sexuality is linked to carnal sex and to men only.

### [Sambian Orthodoxy

[A prime example of a doctrine of sexuality before exposure to the doctrine of Christendom is that of the Sambia people of Papua New Guinea studied by Gilbert Herdt (1981, 1987; see summary in Section 13 of the chapter on Papua New Guinea in this volume). This was not a sex-negative doctrine, but it was linked to abusive indoctrination in boyhood in preparation for intertribal killing to qualify for manhood. In a Sambia farming hamlet, when a cohort of prepubertal boys in the mid-juvenile age group were separated from the perceived dangers of the influence of females, they lived, ate, and slept together in the long house, a kind of male dormitory. They were ready for the first stage of their initiation into manhood. Its ceremonial beginning lasted several days and nights and can be summed up as brutal ceremonial hazing and brainwashing, including food, water, and sleep deprivation, nose piercing, and being hauled naked across the shoulders of a male sponsor along an avenue of older males armed with whips for lashing them. The mystery of the secret ceremony of sucking the flute consisted of enforced sucking of the penis of an older, unmarried youth in the men's house. It was the duty of the older boy (or boys) to supply the younger ones with enough "men's milk" to ensure that they would be able to develop pubertally. When the younger boys became old enough to make men's milk themselves, then it was their duty to have it sucked out by still younger ones.

[The mystery of what happened in the men's house must be kept secret from all females and uninitiated males. Looking at or talking to females, even one's mother, was strictly forbidden. At around age 20, the tribal age of marriage, the tribal elders found a suitable bride in a neighboring hamlet. The candidate for marriage had to prove his worthiness by

participating in an intertribal war party, and returning home with the body of a slain enemy. Initiation was final and complete when the first child was born.

[Some men raised up in this system fell in love with their wives, though some did not. A few had evaded the men's milk ritual as often as possible, but none had become exclusively gay in the Western sense.

[Women talked only to women about their sexuality, so that, in the absence of a woman ethnologist, data are lacking. After World War II, Australian governmental patrols suppressed the indigenous sexual orthodoxy in favor of the orthodoxy of Christendom.

### [Malleability: The Paraphilias

[During its critical formative stage as a personalized lovemap in the individual, or as a shared doctrine in the community, human sexuality is self-evidently malleable to some degree. That does not by any means signify that sexuality is infinitely malleable regardless of chronology. Nonetheless, it is an all-but-universal axiom in Western culture that sexuality is forever malleable and subject to voluntary control. Sexuality that proves to be unmalleable is at risk of being classified as lawbreaking and maybe a crime. It is subject to chastisement, punishment, deprivation, torture, and in some instances, the death penalty.

[Only a small cadre of biomedical scientists engage in a truly scientific search for causal explanations of human sexuality and its aberrations, which is nowhere more clear than in the case of the paraphilias, legally known as the perversions. Paraphilias often give the impression of being as idiosyncratic and contrived as the plot of a novel or screenplay and, therefore, easily altered. That puts the cart before the horse insofar as an author may well have drawn on his or her own uniquely paraphilic disposition for the theme of his or her art. Thus, the novels of the Marquis de Sade gave his name to sadism, the paraphilia, and those of Leopold von Sacher-Masoch gave his name to masochism.

[It is a remarkable feature of the paraphilias that no two people have a paraphilia which is an exact replica, the one of the other. It is the theme that they share, not the precise details. It is also remarkable that, despite idiosyncratic variations, the paraphilias can be cataloged as exemplifying seven major themes or stratagems. These stratagems are trickeries whereby neither love nor lust is forfeited, but both are saved by being separated or dissociated, often with one partner for love and another for lust.

[The origin of the paraphilic stratagems is probably before recorded history, and they probably embody extremely ancient paradigms of wisdom (so ancient that they are called paleodigms; Money 1989). They now survive in the legends and myths of folk wisdom—for example, the folk wisdom that sacrifice leads to expiation of guilt. Listed by name only, the seven grand stratagems of the paraphilias are as follows: sacrifice and expiation; marauding and predation; mercantilism and venality; fetishism and talismanism; stigmatism and eligibility; protectorship and rescue; and solicitation and allure (see Money 1997, 252; 1999, 125).

[At one extreme, paraphilias may be rated as inordinately fixated and life threatening. At the other extreme, by contrast, they are ludic (playful) and erotically enhancing.

[The transcultural record is incomplete as is also the historical record, so that the comparative occurrence and prevalence of the paraphilias in time and place is not known. One likely possibility is that the paraphilias are specifically an offshoot of Christendom's dark side. They represent a slowly progressive evolutionary accommodation to the austerity of Christendom's doctrine of sexuality for procreation only. In other words, the social evolution of

paraphilic sexuality is taking place under our very noses and we are not perceiving what is happening.

[The majority of the paraphilias are not named in *DSM-IV-TR* (APA 2000) except as "Not Otherwise Specified." For many of these, there was no scientific name until the book *Lovemaps* was published (Money 1986). Earlier, they had been named, if at all, only in street slang, or in the criminal justice vocabulary of lawbreaking, or in the ecclesiastical vocabulary of heresy. Their recognition as sexological syndromes began in tabloids and pictorials where individuals could search for and maybe correspond with others similar to themselves. Then, at the end of the 20th century, came the great invention of the Internet on which people with the same paraphilia could find and communicate with one another. On the Internet, unknown paraphilias became known and compared, and little-known paraphilias became more prevalent than had previously been suspected, women's paraphilias included. It remains to be seen whether or not the Internet confirms that women's paraphilias are more contractative than men's, and men's more visual than contractative.

[It would be scientifically foolish to expect the human genome to be phylogenetically coded for a fetish for nylon pantyhose, since nylon is a 20th-century invention. However, it would not be foolish to propose that the erotic feel of human skin might be transposed on an ontogenetic basis to nylon, and that the erotic feel of nylon could thenceforth become fixated, if not indefinitely, then for an extended period of time (think native language again). The paraphilias are, indeed, strongly resistant to change. However, over the years of a lifetime, a paraphilia may spontaneously metamorphose or undergo remission (Lehne & Money 2000, 2003).

### [Doctrinal and Sexual Orthodoxy

[In human sexuality, doctrinal orthodoxy is under the control of those who have the power to enforce it by way of laws, taboos, prohibitions, and punishments. The information provided, in the United States and country-by-country, in this *International Encyclopedia* allows a scholar to trace the global range and dispersal of Christendom's doctrine of sexual orthodoxy. In other cultures in the United States, as well as in other countries, information about the history and current status of Muslim, Confucian, Buddhist, Hindu, animist, and Shinto religious influences provides similar insights into doctrinal orthodoxy in non-Christian cultures. Given the rapid pace of globalization and cultural interactions, neither doctrinal nor sexual orthodoxy are static doctrines. Both are actively in the process of evolving. (*End of update by J. Money*)

## *Demographics and a Brief Historical Perspective*

ROBERT T. FRANCOEUR

### A. Demographics

Vietnam is the second largest country in Southeast Asia after Indonesia. With 127,240 square miles (329,560 km<sup>2</sup>), it is twice the size of the state of Arizona, slightly larger than Malaysia (including East Malaysia), and about 15% smaller than Japan. Vietnam is bordered on the north by China, on the east by the Gulf of Tonkin and the South China Sea, and on the west by Cambodia, Laos, and the Gulf of Thailand. The country extends some 1,000 miles (1,600 km) from north to south. Its widest east-to-west point is 370 miles (600 km), whereas in some places it is only 30 miles (50 km) wide. The capital, Hanoi (2.194 million), is situated in the northern region, while the largest city, Ho Chi Minh City (4.392 million), the former Saigon, is in the south.

In July 2002, Vietnam had an estimated population of 81 million, up from only 47 million in 1975. (All data are from *The World Factbook 2002* (CIA 2002) unless otherwise stated.)

**Age Distribution and Sex Ratios:** 0-14 years: 31.6% with 1.07 male(s) per female (sex ratio); 15-64 years: 62.9% with 0.96 male(s) per female; 65 years and over: 5.5% with 0.65 male(s) per female; *Total population sex ratio:* 0.97 male(s) to 1 female. Almost 80% of Vietnamese are under age 40.

**Life Expectancy at Birth:** *Total Population:* 69.86 years; *male:* 67.4 years; *female:* 72.5 years

**Urban/Rural Distribution:** 19% to 81%. The rural population is concentrated in the two main rice-growing deltas: the Red River in the north and the Mekong in the

(CIA 2002)

south. In the Red River Delta (excluding Hanoi), population density averages 1,170 per square kilometer (0.4 mi<sup>2</sup>), and in Thai Binh it rises to 1,230 per square kilometer (0.4 mi<sup>2</sup>), among the highest rural densities in the world. The Mekong Delta, which is over twice as large as the Red River Delta, has a far lower population density at 400 per square kilometer (0.4 mi<sup>2</sup>) and is the source of the rice surpluses that Vietnam exports.

**Ethnic Distribution:** Vietnamese: 85% to 90%; Chinese, Hmong, Thai, Chm and mountain group minorities.

**Religious Distribution:** Buddhist, Hoa Hao, Cao Dai, Christian (predominantly Roman Catholic and some Protestant), indigenous beliefs, and Muslim

**Birth Rate:** 20.89 births per 1,000 population

**Death Rate:** 6.14 per 1,000 population

**Infant Mortality Rate:** 29.34 deaths per 1,000 live births

**Net Migration Rate:** -0.47 migrant(s) per 1,000 population

**Total Fertility Rate:** 2.44 children born per woman

**Population Growth Rate:** 1.43%

\**Communications:* Jakob Pastoetter, Ph.D., Eichborndamm 38 D-13403, Berlin, Germany; jmpastoetter@compuserve.de.

**HIV/AIDS** (1999 est.): *Adult prevalence*: 0.24%; *Persons living with HIV/AIDS*: 100,000; *Deaths*: 2,500. (For additional details from www.UNAIDS.org, see end of Section 10B.)

**Literacy Rate** (*defined as those age 15 and over who can read and write*): 93.7% (*male*: 96.5%, *female*: 91.2%) (1995 est.); education is free and compulsory from age 6 to 11

**Per Capita Gross Domestic Product** (*purchasing power parity*): \$2,100 (2001 est.); *Inflation*: -0.3%; *Unemployment*: 25% (1995 est.); *Living below the poverty line*: 37% (1998 est.)

Traditionally, education has been of great importance to the Vietnamese, and the State has always set aside a significant portion of its budget for education. Although access to higher levels of education has been limited, the introduction of near-universal primary education has produced a high literacy rate. According to the 1999 World Bank figures, 83% of the population over 15 years old was literate. [*Comment 2001*: The meaning of “literate” is not specified, whether this means able to write one’s name, or able to read a newspaper. (*End of comment by R. T. Francoeur*)] In rural areas, the education system has been nearly as well developed as in urban areas, particularly in the north: 87% of the rural population was literate in 1989 compared with 95% of the urban population.

Vietnam has a good record in providing healthcare, as measured by such indicators as life expectancy, infant mortality, and the number of doctors per citizen. After 1954, the government set up a public-health infrastructure, which reached down to hamlet level. This system was extended to the south after reunification in 1976. In the late 1980s, a combination of reform factors, budgetary constraints, the decision to shift more responsibility for healthcare financing to the provinces, the reduced social role of agricultural cooperatives in 1988, and the introduction of fees in 1989, began to affect the quality of healthcare. By 1996, the government was devoting only 1% of the gross domestic product to health spending, and 85% of all spending on health services came from private sources.

Vietnam has one of the most complex ethnolinguistic patterns in Asia. About 50 different ethnic minorities make up more than 10% of the population, while approximately 87% of the population is ethnic Vietnamese (Kinh). The Vietnamese were significantly Sinicized during a millennium of Chinese rule. Vietnamese, one of the Mon-Khmer languages of the Austro-Asiatic language family, exhibits strong Chinese influence. Diverse cultural traditions, geographic variations, and historical events have created distinct traditional regions within the country. The general topographic dichotomy of highland and lowland regions also has ethnolinguistic significance: The lowlands generally have been occupied by ethnic Vietnamese, while the highlands have been home to numerous smaller ethnic groups that differ culturally and linguistically from the Vietnamese. The highland peoples can be divided into the northern ethnic groups, with affinities to peoples in southern China, and the southern highland populations, with ties to the Mon-Khmer and Austronesian peoples of Cambodia, Indonesia, and elsewhere in Southeast Asia (see Section 13, Sexual Attitudes and Behaviors among Ethnic Minorities).

A north-south variation also evolved among the ethnic Vietnamese as they expanded southward from the Red River Delta along the coastal plain and into the Mekong River Delta. The Vietnamese themselves have long made a distinction between the northern region, with Hanoi as its cultural center, the central region, with the traditional royal capital of Hue, and the southern region, with Saigon (Ho Chi Minh City) as its urban center. The French also divided

Vietnam into three parts: the northern Tonkin, the central Annam, and Cochinchina in the south. Official efforts to move families from the densely populated areas to the “new economic zones” in the Central Highlands have tended to marginalize the minority groups living there, in addition to causing ecological stress.

The once sizeable overseas Chinese community, which was largely concentrated in the south, was depleted after many decided to leave the country as “boat people” when the government closed down private businesses in 1978. The 1989 census counted 962,000 Chinese, barely changed from the 949,000 recorded in the 1979 census. But as elsewhere in Southeast Asia, the Chinese minority wields great influence in the economy. Ho Chi Minh City alone is estimated to have about half a million Cantonese-speaking ethnic Chinese residents.

Vietnamese is the official language. Although the Vietnamese language is distinct, it nevertheless can be described as a fusion of Mon-Khmer, Tai, and Chinese elements. The minorities have languages of their own, and the Constitution guarantees their right to use these languages before the courts. English is gaining popularity as a second language, whereas many people still speak French, Russian, and German. In the early 17th century, Catholic missionaries introduced *chu quốc ngữ* (“national written language”) using an adapted form of the Western alphabet. The four letters, *f, j, w,* and *z,* are omitted, and accents are added. The resultant *chu quốc ngữ* was made popular by the French and has been used officially since 1918. In Vietnamese, quite a few words are spelled in the same way. Differences in meaning result through pronunciation: e.g., *ca* (to sing), *cà* (eggplant), and *cá* (fish).

The names of the authors, researchers, institutions, titles of books, and locations occurring in this chapter are written in the form in which they were used in the international research literature. In order to facilitate literature searches, Vietnamese authors are referred to in exactly the writing of their names in the quoted articles and books. To avoid confusion for the non-Vietnamese users of the *International Encyclopedia of Sexuality*, who might not know what the family, middle, and first names are, we also did not alter the order of the three parts of the names, but used the form we found.

## B. A Brief Historical Perspective

The two most characteristic features of Vietnam’s history are the country’s struggle against foreign occupation and intervention, which has been going on for a good part of the last 2,000 years, and the ability of the Vietnamese people to learn from their occupiers and finally overcome the foreign rule. The invaders were mostly, but not exclusively the Han Chinese, who ruled Vietnam for over 1,000 years from 111 B.C.E. to the 15th century. The Chinese were also in power during the wars between the Monguls and the Cham state, from 1428 to 1672, when Le Loi expelled the Chinese and was crowned emperor. In the middle of the 19th century, the French began intervening in the country’s affairs on a large scale. Within ten years of seizing Saigon, they had taken control of the whole country, which they governed as a colony and incorporated into French Indochina in spite of resistance from the Vietnamese.

After 1940, when France surrendered to Germany in World War II, the Vichy government had to accept the presence of Japanese troops in Vietnam, although the Vichy government continued to govern the colony. During this period, Ho Chi Minh founded the Viet Minh, a nationalist liberation movement inspired by communist ideals, whose aim was to free Vietnam from foreign rule. A few months before the Japanese were defeated and finally surrendered to the Allied

forces in September 1945, the Viet Minh took direct control from the French, and Ho Chi Minh declared the Democratic Republic of Vietnam independent on 2 September 1945.

After the end of World War II, the French deployed a substantial number of troops and fought the Viet Minh, led again by Ho Chi Minh, in order to regain control over Vietnam. The French were defeated decisively in 1954 at Dien Bien Phu and were forced to withdraw after they had dominated Vietnam for almost 100 years. However, the Viet Minh controlled only the northern part of Vietnam. The establishment of a second government, led by Ngo Dinh Diem in Saigon, led to the separation of the country into North and South Vietnam along the 17th parallel, the latter backed by the United States. Under the influence of the Korean War and the so-called domino theory, the United States gave South Vietnam political and military support against North Vietnamese attempts to take over the south. The United States' involvement gradually grew from a few advisers to hundreds of thousands of ground troops to fight the National Liberation Front, otherwise known as Viet Cong. Nevertheless, the Viet Cong and the North Vietnamese prevailed. In 1973, the United States signed a treaty with North Vietnam that provided for withdrawal of all American ground troops and aimed at restoring peace. After the American withdrawal, the government of South Vietnam crumbled rapidly and the North took control in 1975, ending a war that had lasted nearly 30 years. In July 1976, the nation was reunited, and the Socialist Republic of Vietnam was established.

Important events since the reunification of the country include a border war with China in 1979 and Vietnam's invasion of Cambodia the year before. Vietnam finally withdrew its troops from Cambodia in 1989. Perhaps the key feature, though, was the country's economic deterioration and its dire position by the mid 1980s. The breakthrough came at the end of 1986 with the introduction of the *doi moi*, or renovation policy. The aim was to move from a centrally planned to a market economy while still retaining the socialist political structure. The introduction of the new foreign investment law in December 1987, allowing and encouraging foreign investment, was a major step from which all the current excitement in the international business community has stemmed. Parallels have been drawn to China's experience. Such has been the rapidity and the strength of the process, that the near-total withdrawal of Soviet aid in 1991 and the collapse of the COMECON trading bloc, which should in theory have cut away the great majority of Vietnam's trade, had little effect.

There is now far greater openness towards foreign countries in general, and improved relations with other Southeast Asian and Western nations in particular. Vietnam became a full member of the Association of Southeast Asian Nations (ASEAN) at the meeting in Brunei in July 1995. Full diplomatic relations with the United States were reestablished in July 1995, some 20 years after the fall of Saigon.

Nevertheless, Vietnam is in desperate need of foreign investors. Over the last six years, the inflow of foreign capital dwindled from US\$3 billion to little more than US\$500 million since Vietnam lost its privileged position as favorite of Western investors because of the multiple domestic and external trading restrictions and widespread corruption. Many foreign investors have left the country in frustration, according to the *Neue Züricher Zeitung* (7/14/2000). The situation might change as a result of normalization of trade relations between the U.S. and Vietnam in 2000, which opened the Vietnamese market for American investors in such important key sectors as telecommunications and financial services. Still, Vietnam is one of the world's poorest countries. Its average per capita gross domestic product is esti-

mated to be about US\$150 per year; the statutory minimum wage is US\$35 per month in Ho Chi Minh City and Hanoi and US\$30 elsewhere for local employees employed by foreign invested enterprises. The economic reforms during the last few years have permitted some people to fare better in the private sector, but overall living standards still remain low. Viewed in this light, it is evident that, even with an inflation rate decreased from almost 400% in 1988 to 17% in 1995, it will be many years before Vietnam comes close to reaching the financial strength attributed to some of its Asian neighbors—especially since the growth rate for 1999 dwindled to 3% from an official estimate of 5.8% in 1998.

Real household income per head rose by 5% in 1995 and 4.2% in 1996. The percentage of people living in poverty (as defined by the World Bank) has fallen from almost 55% in 1992 to less than 30% by 1998. The poorest quintile of the population does not appear to have fared so well. Between 1994 and 1996, its income per head rose by just 0.5% annually, far less than the annual growth of 6.8% experienced by the top quintile.

Official figures obtained by Reuters show less than 600,000 foreign tourists visited Vietnam in 1998, down from 690,000 the previous year, a drop the government blamed on Asia's economic crisis. Hanoi lumps tourist figures with total arrivals, including business and official visitors, ending up with a figure of 1.5 million in 1998, down from 1.7 million in 1997. Its goal in 2000 was two million total visitors, compared with nearby Thailand, which expected to attract 8.2 million tourists during the same period.

### 1. Basic Sexological Premises

*Author's Note:* Because of the specific difficulties of doing sex research in a communist and Neo-Confucian country like Vietnam, we could not do field research on our own, and instead had to rely on the published papers and books about Vietnam. The challenge we faced in preparing this chapter was confirmed early on by Professor Frank Proschan, an expert on Vietnamese culture at the Folklore Institute at Indiana University (Bloomington), who told us that no Vietnamese scholar would be able to write such a chapter, because the Vietnamese have just started walking the path of independent science after many years of Confucian and communist censorship. The Vietnamese resources we subsequently found and incorporated into this chapter supported this thesis. Because the resources came from many different fields of research—history, medicine, ethnology, anthropology, sociology, religious studies, sexology, and sociology—we thought it best to leave them as much unchanged as possible to prevent misinterpretation (compare Gammeltoft 1999). At the same time, we also tried to make the text as readable as possible, without too many direct quotations or heavy use of indirect speech. Nevertheless, the chapter should be transparent enough to track all the sources down to find more in-depth information if necessary.

What information we have on contemporary sexuality in Vietnam had to be gleaned on the one hand from the Vietnamese and international anthropological and ethnological literature, as well as AIDS, STD, and family planning research (compare Sections 9, Contraception, Abortion, and Population Planning, and 10, Sexually Transmitted Diseases and HIV/AIDS). On the other hand, there exists the domestic social science research, which is focused mainly on "gender and development," and more recently on the nature of the Vietnamese family. For the French period, the late 1800s and the first half of the 20th century, we used mainly the works of Jacobus X. (1898, writing as "A French

Army-Surgeon”) and Annick Guénel (1997). For the Vietnam War period, a major resource was *Saigon After Dark* by Philip Marnais (1967). We emphasize that neither Jacobus X. nor Philip Marnais are acknowledged anthropologists or ethnologists. Although their writings are quite sensationalistic and written from the point of view of a so-called ethnoerotologist and an American journalist, respectively, the facts they provide are regarded as reliable, even if they reveal more about the colonial fantasies and fears connected with “alien” sexuality, than they do about the perception and feelings of the native Vietnamese. Last but not least, Professor Frank Proschan of Indiana University, an expert on Vietnamese culture at the Folklore Institute, provided us not only with his own findings, but also books and articles about other subjects only available in Vietnam. We cannot stress the fact enough that without him we would not have been able to include reliable information about the Vietnamese homosexual culture. Additional information, as well as confirmation, was acquired by interviewing Vietnamese students at Indiana University and the Kinsey Institute and author Robert Taylor (1997), who served as an officer in the U.S. Army during the Vietnam War.

### A. Character of Gender Roles

#### *Reality and Fantasy*

The character of Vietnamese gender roles reflects the over 2,000-year influence of Confucianism, which is still the most important single influence on gender roles. Vietnamese women were comparably less degraded by the “three submissions” (to father, husband, and eldest son) and the four virtues (skill with her hands, an agreeable appearance, prudence in speech, and exemplary conduct) than women in China (see Section 2, Religious, Ethnic, and Gender Factors Affecting Sexuality). Gender roles in Vietnam are changing rapidly, though with different speeds in different social layers. Although men are still more visible in society, it is not necessarily a sign of their also having more power. Far from a clear picture, the one sure statement is that Vietnamese gender roles are loaded with contradictions.

There is still a continuity of Vietnamese ideas of the power of women within the household (“the general of the interior”), and the way in which state socialism splits men and women. For example, the Peasant Union represents men and the Women’s Union only women, thereby encouraging a popular public view that women are not farmers and need not be directly involved in economic change, although up to 80% of the field work is done by them. Also, the psychological dimensions of male-female relationships within the family and community are unrepresented and unidentified in the State bureaucracy, and new contradictions begin to emerge between the power of women in the family and culture and their empowerment by the state. As Wazir Jahan Karim observed in 1995, “This seems to be a repeat of a typical Southeast Asian model of change and development: that women continue to experience contradictory statements of their usefulness and power, and that the public view usually contradicts the popular.”

Unlike the prevalence of male domination in neighboring cultures, the earliest legend about the founding of Vietnam claims equality among the spouses. The mythic founders of Vietnam were a couple, Au Co, the wife, and Lac Long Quan, the husband. The husband was a dragon, suited to live on the coastal plains; the wife was a fairy who wanted to live in the mountains. As they agreed to part, 50 sons followed their mother and governed the northern part of Vietnam, while 50 sons followed their father and reigned over the kingdom bordering the South China Sea. Before separating, they pledged mutual respect and aid in time of crisis.

Vietnamese folklore, female Buddhas, goddesses, and proverbs seem to show that Vietnamese women have some influence in society. Goddesses commonly presided over the cultivation of rice and other food crops. Streets and districts are named after female cult heroes, such as the Trung sisters (40 C.E.), who led a revolt of independence, and Trieu Thi Trinh, who took up a similar warrior role in the 3rd century. She is described as nine feet tall, with three-foot-long breasts and a voice like a temple bell, able to eat a bushel of rice and walk 1,500 miles (2,400 km) in a single day. Vietnamese nationalists have also resurrected the poetry of Ho Xuan Huong, a female poet who was critical of gender inequality more than 50 years before French colonization.

[*Update 2003*: In a recent analysis of “Romantic Love and Gender Hegemony in Vietnam,” Alexander Soucy (2000) argues that the government of the Socialist Republic of Vietnam has not been very successful in its effort to achieve gender equality. While the government has rejected the patriarchal Confucian dictates of the three submissions and four virtues of women, young Vietnamese women continue to be subservient to men. In Soucy’s view, the ideal of romantic love, as disseminated through the popular mass media, is a new form reinforcing old structures of gender hegemony (Soucy 2000). (*End of update by J. Pastoetter*)]

#### *Gender and Economic Control*

Nearly all the country’s market stalls today are run by women. Though they are more often small merchants, it is interesting that the richest private capitalist in Vietnam today is also a woman. Not only do women form the overwhelming majority of all active merchants in the country, they constitute the majority of the customers as well. As O’Harrow (1995) points out, in spite of the male role of provider, which is implicit in the Confucian paradigm, Vietnamese mothers raise their daughters to understand, if not explicitly, then by example, that they should always have their own money and cannot depend on men.

The most commonly acquired commodity for this kind of female protective investment is jewelry, preferably in unalloyed gold or with recognizable gems. Young girls quietly watch their mother’s elaborate systems of boxes, jars, purses, hidden floor boards, and furtive containers of every kind and dimension, never opened in the father’s presence. They observe and learn. The extraordinary interest Vietnamese women appear to take in jewelry is commonly misunderstood by outsiders as simple vanity. But in fact, the precious contents are considered the mother’s property and will stay with her should she leave.

#### *Relationships Between (Married) Women and Men*

According to O’Harrow (1995), the polite term for a wife is *noi tro* (“interior helper”), the common, not-so-polite epithet is *Noi Ttoug* or “general of the interior.” The women of Ha Dong, in particular, have a reputation for being fierce spouses that has gained them the nickname of *Su Tu Ha Dong* or “Ha Dong Lionesses.” It is said about their husbands that they belong to a very ancient club, the *Hoi So Vo* or “Society of Men Who Fear Their Wives.” Folk humor aside, it is a strategy to survive that motivates women to gain control of the family finances. Because the wife is, in fact, the backbone of the family, many families get into deep trouble or even break up when the wife/mother dies. The social system in Southeast Asia is based on a system of moral debts and balances. The relationship between (married) women and men is not one between two individuals, but between two life projects which depend on one another. Break one side away and the whole system crumbles.

Contrary to Western notions, where feelings of guilt support freedom before marriage but faithfulness afterwards, in societies where shame and the notion of virgin marriage is operative, extramarital affairs outnumber premarital ones. If a Vietnamese woman takes a lover and can keep the fact secret and so avoid shame, she can maintain an upper hand. The man, on the other hand, while much less bound by problems of public shame for having a girlfriend, is more likely to be worried about surrendering self-control and so losing his face. As O'Harrow (1995) points out, Vietnamese women seldom have male friends, *per se*, because they have very few social mechanisms for dealing with men on an equal footing. Men are always patrons or clients, fathers, sons, husbands, or lovers. A wife deals with her husband with the same mechanisms that a mother uses to deal with her son, and a lover is usually treated as a daughter treats her father. So one can understand why tales of female sexual insatiability also attach to the Ha Dong lioness myth: It is the woman who controls the man, and he is the one who loses face.

#### *Relationships Between (Unmarried) Women and Men*

It seems that at least in the urban centers of Vietnam, women are behaving in quite the same way as in the Western world: They have boyfriends and have sexual intercourse with them, but they are still anxious to pretend that the current boyfriend is the first and only one. Over 95% of the 279 unmarried women in the Hanoi sample of Bélanger and Hong (1998) had a boyfriend at the time of the survey, and they defined a boyfriend as a male friend with whom they had a committed relationship, and in most cases, a person with whom they had sexual intercourse. Once dating was initiated, one third of the women had had their first sexual experience in less than a year. After a year, two thirds had had sexual intercourse. The average duration between the two events was about 15 months. Most of the women did not engage in sex unless they knew their boyfriend for some time. Nevertheless, all the women but one said that their boyfriend took the initiative to engage in sexual relations. It was also not possible for them to introduce the subject of birth control, or to reveal that they had boyfriends before him. The women were afraid that, if they revealed their previous experiences to their current boyfriends, they might lose his respect and thus damage the relationship. They may obtain an abortion if they do not want to marry him (at least at the moment).

#### *Proper Work for Women*

According to the Confucian cultural norms, women in pre-revolutionary Vietnam were supposed to have little or no authority in any sphere—political, economic, educational, or familial. There were no women in the “council of notables” that governed the village, nor were they part of the village political community that met in the communal hall. Because a woman was always incorporated within a family and subject to male authority within the family, a woman's economic management and enterprise was always subject to male control and therefore not “real” authority.

Under Communist rule a new social role for women in the countryside has opened up: *co giao*, “Miss Teacher,” who teaches her pupils norms and behaviors, which may conflict with those of the parents. Vietnamese studies cite with approval cases where rural students admonish their parents on the grounds that “Miss Teacher would not like it,” “it” being, for example, not boiling water before drinking, or quarreling. However, women's present leading role in primary-level education, as well as in health, is conceptualized as an extension of women's traditional role in the family: teaching children and caring for the sick.

As Pelzer White (1987) further points out, women are seen as making good cooperative accountants only as an extension of their traditional role as the keeper of the household budget. On the other hand, young men would never be allowed to train for careers as caretakers of very young children and infants. Only during the war was there a policy, expressed in a 1967 law, to promote women to leading positions in the countryside. The percentage of women acting as cooperative chairmen and other management posts shot up. After demobilization, however, the roles changed again. Even today, women face hostility from their husbands, and especially from their mother-in-laws, if they have higher status jobs.

#### *The “New” Vietnamese Middle-Class Woman*

As Fahey (1998) observed, over the past ten years, Vietnam has witnessed a dramatic change in the images of women. The globalization process has drawn many urban women into the commercial sphere, as consumers of products as well as models with which to advertise products.

Nevertheless, the images of the women visible in the streets remain contradictory. The communist ideal for women was equality with men, to be achieved through the demise of private property and women's domestic role. Interestingly, women were also highly praised by the Communist Party as freedom fighters and war heroes; however, they are underrepresented in the political hierarchy. Female members of the National Assembly and of the Vietnamese Communist Central Committee do exist, but they represent an infinitesimal portion of the whole, and exercise almost no real decision-making power. The Politburo has never had a female member, and the female representation in the National Assembly began to decline immediately after the war, from 27% in 1976, to 22% in 1981, and to 18% in 1987 (Fahey 1998). By 1992, the proportion had increased only marginally, but it was expected to decline as the quota that required proportional female representation of 18% was eliminated before the last election. Such data suggest that the recent changes in women's position may have less to do with economic renovation as such, and more to do with restoration of certain aspects of pre-war gender practices. However, as Vietnamese women told Fahey (1998), they regard the decline in representation as irrelevant, because the National Assembly is losing authority and ambitious women can use their time more productively in private enterprise.

On the other hand, Vietnamese women are flooded with more and more Western images of how up-to-date women live. Beauty contests, fashion clubs, and magazines exert the strongest influence. Fahey (1998) reported that fashion clubs appeared in the early 1990s, with members including fashion designers, models, and companies eager to establish a fashion industry. The first modeling agency, CATD, begun by a young overseas Vietnamese woman, was licensed in Vietnam in 1995. Vietnam now has two locally produced fashion magazines: one for women in general (*Thoi Trang*) and the other for younger women (*Thoi Trang Tre*). Another magazine called *Thoi Trang Dien Anh* [*Movie Fashion*] reproduces sections from international fashion magazines, including French and American fashions, and appears to be more popular in the South. These magazines also have small sections for men, perhaps indicating that the commercialization of beauty is not entirely limited to women. Most newspapers now have a women's section that covers topics from how to pluck eyebrows to Japanese-sponsored parades.

A popular activity for middle-class women, especially those with substantial independent incomes, is attending the gym before work. The membership fee is about US\$10 per month or 5 to 10% of these women's monthly income.

Interviews with these women reveal that they attend them both for social interaction and to improve their body shape. Although they are conscious of maintaining a shapely body, and coyly admit this, they inevitably refer to both inner and outer beauty when asked open-ended questions about the definition of a beautiful woman.

### *The Male Gender Image*

Proschan (1998) observed that traditional Vietnamese society was strongly shaped by Neo-Confucian conceptions and practices of ancestral veneration and filial responsibility (*hieu*):

A man's most important duty is to reproduce a male child to carry on the ancestral line: "The Annamite\* loathes dying without being assured of male dependants. One can say that there exists a veritable obligation, of the religious or at least mystical order, to give birth as early as possible to the cult's heir" (Khèrian 1937, 29). Ethnologist Nguyen Van Huyen noted in 1939 that "male celibacy is always in complete disfavor. It continues to be considered as an act of filial impiety," with bachelors prohibited from participating in certain family and village rituals (Nguyen Van Huyen 1944/1939, 41). The tenacity of this traditional stricture is evident from current census data: of Vietnamese males over the age of 40, barely 1% has never married (Vietnam Population Census 1989).

That Vietnamese men are as imbued with the work ethic as the women can be attested to by any observer of the economic activity of the Vietnamese refugee communities in the West, where Vietnamese men commonly hold two or sometimes three jobs at a time to support their families. But the popular notion persists, commonly abetted by male authors, such as the 19th-century libertine and poet, Tran Te Xoung (1890), that the height of machismo is not some Mediterranean predilection to physical abuse of women, but rather a gentlemanly idleness at their expense: "Drink and gamble 'til you're in over your head, but even if you are out of money, your kid's mother is still out there selling her wares."

It is interesting to note that during the Vietnam War, men envied the American soldiers. Vietnamese men have little or no body hair, but hairiness is regarded as a strong symbol of masculinity. It seems to have put men into a state of constant humiliation to watch hairy GIs being admired by Vietnamese women. The body image of men was changing a lot in the 1990s. The bodybuilding industry began to boom. Today, street posters of bodybuilders, often with Western faces, advertise gymnasiums; national competitions are held; and magazines are available for those who wish to know more. The body shape acquired by bodybuilders is significantly different from that of the majority of Vietnamese men, and there appears to be no precedent for such a practice. As to how Vietnamese men will be able to deal with this strong influence, and how it will change their attitudes toward their bodies are important questions.

## **B. Sociolegal Status of Males and Females**

### *Children and Adolescents*

Over 100 years ago, Jacobus X. (1898), whose observations as "A French Army-Surgeon" are regarded as quite reliable "although embed with racist and colonialist attitudes of superiority" (Proschan letter 2000), observed that children were breastfed until they were 3 or 4 years old if a boy; and even longer if it was a girl. When the Vietnamese child could

walk alone, he was allowed to run free, almost or quite naked, or roll in the dust, or wallow in the mire. After he was 12, he wore a ragged pair of pants and an old coat, the cast-off garments of his father, and then went to work, minding the buffaloes, helping his parents cultivate the rice field, or steering the sampan or junk. Children born to concubines had the same rights as the children of the legitimate wife. There was no distinction between "natural" and "adulterine" children in Cochin China. Girls and boys mingled promiscuously, "with the result that might be expected. That is why it is rare to find an Annamite girl, of more than ten years of age, a virgin." But that was 100 years ago.

### *Adults*

Although the Vietnamese adopted the Confucian principle of male superiority, they still granted women some rights. Except for some restrictions concerning properties reserved for ancestor worship, daughters shared in the inheritance of parental properties on the same basis as their brothers. Divorced women and widows who remarried after their husband's death remained the owners of properties acquired during their marriage (*Le Code*, Codex Juris, Articles 388, 374, 375, 376; Nguyen & Ta 1987).

The full and complete equality of Vietnamese women was enshrined in the first Constitution of the Democratic Republic of Vietnam of 1946: "Women enjoy equal rights with men in all spheres." The 1980 Constitution guarantees equal rights for men and women in all respects, although a resolution passed by the Council of Ministers in December 1984 highlighted problems involved in promoting female status. Women are still a minority at the executive level. On the other hand, Vietnam has an official matriarchal heritage.

## **C. General Concepts of Sexuality and Love**

Grammar makes clear how important marriage is in Vietnamese society. Proschan (1998) provides this example: "When Vietnamese ask one another about their marital status they do not ask 'Are you married?' but 'Have you married yet?' A proper response is not a yes-or-no answer but the answer 'Already' or 'Not yet.'" Although the minimum legal age at marriage is 18 years for women, postponing marriage until age 22 is strongly recommended. Up to and through the French Colonial period, Vietnamese women were not regarded as nubile until about their 16th or 17th year. However, according to the *Ly-Ky* [*The Book of Rites*], girls might marry after 14 years and men at 16. Any marriages prior to those ages were not accepted.

According to Proschan (1998), if men feared that marriage might complicate their lives, they tried to find a girl who did not see in them as the focus of her desires and demands. In fact, many Vietnamese men believed that women were perfectly satisfied with something like a companionate marriage, which involved sufficient ardor to produce offspring, but was not complicated by passionate desire. A hundred years earlier, Jacobus X. (1898) confirmed this rather unromantic view of marriage:

Marriage is for the Annamite a question of business and the procreation of descendants, rather than of sentimental love. On her side, the woman has not generally a very great affection for her husband, but concentrates all her love on her children.

Proschan (1998) writes that before colonial and revolutionary legal reforms made monogamy the only acceptable form of marriage, polygamy (specifically, polygyny) had been equally legitimate. When polygyny lost its legal sanction, it nevertheless continued outside the law, and women in polygynous relationships lost the protections

\*Annamite(s) is the term used for the Vietnamese during the periods of the Kingdom and French Protectorate.

and rights that the older legal codes had afforded their predecessors—i.e., those of second wives or concubines. Indications are that extramarital heterosexual relations were frequent enough among married men that most people—male or female—assumed that they were the norm. There were numerous available partners—female or male—for men whose wives “fail[ed] to provide proper attention and stimulation” (Khuat Thu Hong 1998), as one researcher characterized the common rationale.

## 2. Religious, Ethnic, and Gender Factors Affecting Sexuality

### A. Source and Character of Religious Values

#### *Religious and Social Factors Present in Vietnam*

The traditional Vietnamese religion includes elements of Hinduism and all three Chinese religions: Mahayana Buddhism, Daoism, and Confucianism. Although Confucianism (i.e., Neo-Confucianism in its rather value-conservative form) is without doubt the most influential and deeply rooted of these influences, to say that the Vietnamese are “Confucian” is to oversimplify their social and personal realities. The most widespread feature of Vietnamese Confucianism is the cult of ancestors, practiced in individual households and clan temples. As such, it is strongly tied to folk religion.

There is also a wide variety of Buddhist sects, sects belonging to the “new” religions of Cadoism and Hoa Hao, and the Protestant and Roman Catholic Churches. The number of Christian adherents in 1991 constituted an estimated 7% of the total population: 180,000 Protestants and five million Roman Catholics. The Catholic Church has been active in Vietnam since the 17th century, and since 1933 has been led mainly by Vietnamese priests. The number of Muslims is estimated at 50,000.

While the Vietnamese government guarantees freedom of religion, other factors influencing (and changing) the character of social values can be observed in communist ideology and Western ideas. The latter, first introduced during the French occupation followed by the Vietnam War, has been given fresh impetus since 1986 through *doi moi* economic reforms.

#### *Ancestor Worship*

Ancestor worship, which originated with Confucianism, holds that the soul of the dead person does disappear from sight but stays around to look after the family. Emperors and kings built imperial temples where they worshipped the late emperors whose achievements and exploits were recorded on ancestral tablets and steles. Wealthy people have their family temples for the whole family to worship their ancestors. Poor people, who have no temple of their own, set up an altar in the best part of their home to show gratitude and respect for their ancestors. Because of the war, which produced a serious shortage of dwelling places, most houses are now too small, and very few family temples or permanent ancestors’ altars can be set up.

It is the responsibility of the eldest son to take care of the various anniversaries during the year. For this, he receives income from a number of rice fields or land as a hereditary state. The eldest son records the ancestor’s date of death in a family register.

On the day of the anniversary, the chief of the family, properly attired, stands solemnly before the altar, with three sticks of incense in his hands, held to the level of his forehead, and says the pseudonym, the real name, and the date of death, and invites the ancestor to the feast. At the same time, he will pray to the dead to protect the members of his

family. Various dishes have to be prepared for display before the altar on each ancestor’s anniversary.

Nowadays, probably 70% of the Vietnamese are followers of ancestor worship.

#### *Buddhism*

The origins of Buddhism in Vietnam can be traced to the 2nd century. For the Buddhist, life is seen as a vast sea of suffering. Wisdom lies in the suppression of desires: desires for life, happiness, riches, power, and so on, which are believed to be the roots of human suffering. The very essence of Buddhism is the Law of Karma, which states that man is reincarnated and rewarded in the next life for his good deeds in this life, and punished for his bad ones. The present existence is conditioned by earlier existence and will condition those to follow. Desire must first be overcome; a pure heart is necessary to break the chains binding man to his earthly existence.

In 1920, an organized movement for the restoration of Buddhism began throughout the country. Starting in 1931, Associations of Buddhist Studies were established in the South, the Center, and North Vietnam. Many translations of both Greater and Lesser Vehicle Buddhist Texts were distributed. Finally, after many assemblies of monks and National Delegate Congresses, the Buddhist Institute for the Propagation of the Faith, the *Viean Houa Naio*, was established.

The most important Buddhist sect is Cadoism. Formally inaugurated in 1926, this syncretic religion is based on spiritualist séances with a predominantly ethical content, but sometimes with political overtones. Several other sects exist, like the Tien Thien and the Tay Ninh. It is estimated that these Buddhist sects have two million adherents. Another influential sect is Hoa Hao. Founded in 1939, it has one and a half million adherents.

Through Buddhist-nun monasteries, Buddhism exerted a strong influence for the equality of men and women. Although the monasteries were skeptically regarded by the Confucianist elite—one of the common defamations being that the nuns were involved in lesbian sexual practices—Buddhism gave women another role model besides that of wife and mother. This was especially true for elderly widows who were entering Buddhist orders. On the other hand, their influence on the priesthood seems to be difficult to detect.

#### *Daoism*

Vietnamese Daoism, derived from the doctrine of Lao Tzu, is based essentially on the participation of man in the universal order. This order depends on the equilibrium of the two elements Yin and Yang, which represent the constant duality of nature: rest and motion, liquid and solid, light and darkness, concentration and expansion, and material and spiritual. The material world being imbued with these two principles, the Daoist believes that whoever is able to act according to these principles could become the master of the world. This belief, in turn, has promoted a kind of mysticism, reflected in the magical practices of certain sorcerers who claim to possess the secret of the universe.

The Daoist refrains from troubling the natural order of things; on the contrary, he conforms to it in every circumstance. He considers the taking of initiatives to be a waste of time and energy. In respecting the basic Daoist doctrines of passivity and absence of care, he avoids the active life. These doctrines, which were adopted by many Confucian scholars as well, are summed up in the Daoist maxim: “Do nothing and everything will be accomplished simultaneously.” The supreme divinity of Daoism is the Emperor of Jade. With his ministers of Death and Birth, he controls the destiny of men. The cult is replete with incantations, charms, and amulets,

which once were made for prosperous trade, with the sorcerers intervening in every possible occasion in life.

In the context of sexuality, *yang* is identified with semen or seminal essence (*jing, yin*), which is why Daoists are encouraged to have intercourse often, but without ejaculating. The aim is to build up *jing* but retain *yang* through not ejaculating, but at the same time enabling the woman to reach orgasm and give off her *yin* essence, which additionally strengthens the man. Another Daoist practice is to get a young man and woman together and to gather up their sexual secretions and swallow them—a practice that is believed to prolong life for the Daoist. Jacobus X. (1898) reported that it was still very common at the end of the 1800s, although he did put it strongly as a “strange freak of eroticism”:

The old Celadon is accompanied by a servant or strong coolie, who copulates with a woman in his presence, and then retires . . . When once the agent is retired, well and duly paid, the old debauchee is left alone with the woman, who is still resting upon the field of battle. Then the man approaches, and eagerly receives in *bucca sua*, the liquid which runs *ex vulva feminae*.

### Confucianism

Confucianism, a generic Western term, is a *Weltanschauung*, i.e., a social ethic, a political ideology, a scholarly tradition, and a way of life, but it is not an organized religion. Chinese governors introduced Confucianism to Vietnam from 939 to 1407. The doctrine of Confucius is set forth in four classical texts and in five canonical books. By rigid rules, it determines the attitude that every man in society should adopt to guide his relationships as an individual with his superiors, with his wife and friends, and with his inferiors. The philosophy suggests a moral code, which advocates the Middle Way for the worthy man's behavior. According to Mencius, the most distinguished disciple of Confucius, man is inherently good. To preserve his goodness, he needs to check his passions. The wise man improves himself through study; he knows himself and is the master of his passions.

There are four rules for a man to achieve self-perfection: to cultivate himself, to run his family, to rule the country, and pacify the world. The three important sets of social interaction are between king and citizen, between father and son (*hieu*—filial piety or responsibility), and between husband and wife. Five cardinal virtues have to be achieved in order to become a man of virtue: humanity, equity, urbanity, intelligence, and honesty. As for the woman, Confucius teaches four virtues: skill with her hands, agreeable appearance, prudence in speech, and exemplary conduct, and three submissions or obediences: to the father until she is married, to the husband after she leaves her parents' house, and to the eldest son when her husband dies. Interestingly, the real order as seen by most Vietnamese, and also by the French, is a different one: the Vietnamese woman was inferior to her father but just about equal to her husband, provisionally superior to her minor brothers, and always superior to her sons.

In sexual matters, Confucianism is quite “puritanic.” A “good” young girl is not only expected to keep her virginity until she gets married and to get married only once in her life, she is not supposed to make herself attractive, even to her own husband. Confucianism does not consider sexual activity as wrong, but love and tenderness are treated with mistrust, and physical displays of them are considered at least questionable. This rule applies not only to showing affection in public, but also to its display in the privacy of the home. As early as in the 17th century, male and female poets protested against it.

### “Popular Religion”

As Thien Do (1997) showed, there exists also a very specific Vietnamese “popular religion” characterized by the propitiation of spirits and deities of a certain typology:

1. The tutelary or guardian spirits, either originally worshipped by the villagers or historically instituted by Vietnamese or Chinese rulers. They include the nation-founding patriarch, past male and female heroes, and able ministers;
2. The nature spirits of the grottos, rocks, and trees, and rivers and oceans;
3. Immortals (*tien*) and holy sages (*thanh*), in the Daoist tradition, together with Lady Lieu Hanh and her affiliates, including the Mandarin Snakes and the Five Tigers (Agents), forming the *chu vi* (divine ensemble) in the belief systems of sorcerers and mediums;
4. Deities of Cham and Khmer origin, such as Po Yan Inu Nagar, the Whale Spirit, and the Neak Ta (Ong Ta); and
5. Consecrated to a lesser extent are founding patriarchs of the arts and crafts (including the martial arts), the domestic deities, marginal demonic spirits, and lonely ghosts.

The places of veneration and features of spiritual practices are divided between the village communal house or *dinh*, where local participants emulate the court elite in Daoist-Confucian formats, the private Buddhist-Daoist temple or *chua*, where a three-religion pattern of Chinese origin has been practiced and modified to suit Vietnamese adherents, the trance mediumship, with the special importance of the Earth God and of female deities, and finally the practice of self-cultivation, mainly practiced by Daoists (*ong dao*).

Of importance for gender images is the fact that many of the Vietnamese deities were thought of as female and sometimes even worshipped exclusively by women. This behavior has not stopped with communism or *doi moi*. Since the late 1980s, village pagodas have undergone a frenzy of refurbishment. As Stephanie Fahey (1998) reports, in a pagoda in a village near Hanoi, a local woman pharmacist of 200 years ago is revered for the birth of the prosperous traditional craft of pharmaceutical production, and a temple on West Lake features Ba Chua Lieu, supposedly a princess who developed a prosperous silk industry. The young, as well as the prosperous, patronize these pagodas to implore the appropriate female deities with such different petitions as economic success and the birth of a son. It seems that with the demise of the Communist moral code, the Vietnamese are searching their past for more-traditional values.

Among the religions in Vietnam, the “Popular Religion” seems to be the most liberal in sexual aspects. Khuat Thu Hong (1998) presents dozens of examples that show this liberal attitude from ancient times to the present. Lingam and yoni worship is the most obvious. But there is also the worship of the god No Nuong (*No* meaning a bamboo phallus, and *Nuong*, a vulva, made of a spathe from an areca tree). This worship centers on the ritual striking together of these genital symbols by the village head and deputy village head, while the young boys and girls called out, *tung tung, dap* (onomatopoeia of a drumbeat in Vietnamese) according to the beat. There is also the game of grabbing eels from a jar: In this game, each team of a young man and a woman observed the following rule: While trying to catch the eel in the jar, neither the young man nor the woman could look into the jar, and the young man had to keep one hand on the young woman's breast. At the same time, a committee of judges closely watched, along with fellow villagers who called out and teased them.

### Communism

Communist ideology expects all men to behave according to the principles of a “new society” founded on a Marxist-Leninist base. Regarding gender issues, it implies equality of men and women. Because Engels depicted traditional childrearing practices as the main impediment for achieving gender equality, communist societies tended to socialize childcare and education to enable women to work for the society as men do. The institutions of marriage and the family were considered to be the key to the reproduction of social inequality, because the practices that evolve within these institutions obviously preserved the underlying system of private property and its inheritance. Thus, communist thought was suspicious of devotion to family and treated this as “unsocialist” in a man, especially a Party member. In its first two decades, the Communist government in Vietnam made specific efforts to destroy all Confucian traces in Vietnamese society. To break the strong ties binding members of Vietnamese families that had been molded by Confucian principles, the Communists even encouraged betrayal among family members. Over the years, the anti-Confucian policy has changed Vietnamese family structure considerably. The government has acquired most of the authority and influence attributed to Confucian scholars, especially regarding questions of sexual morality and behavior.

Interestingly, communist gender ideas changed dramatically during the war with the South and after the reunification. The typical functionary now clearly resembled the ideal authoritarian Confucian gentlemen. Women are supposed to care for the family and especially the husband. The few state-honored female revolutionists and freedom fighters fell into oblivion.

At the same time, it was the Communist government that set up the Central Committee for Mother and Infant Welfare in 1971. The committee’s responsibility was to guide and unify the organization of *crèches* (day nurseries). About one third of all children were raised in such facilities. Further support was given to women to separate themselves from domestic duties according to the 1980 State Constitution, Article 63, requiring the state and society to ensure the development of maternity homes, *crèches*, kindergartens, community dining halls, and other social amenities to create favorable conditions for women to work, study, and rest. Even men were asked to share household tasks. But these efforts remained rather at cultural and ideological levels. Vietnamese Communists were keen to maintain the family as a social, but not necessarily an economic unit. For that reason, they argued that it was necessary for women to handle both employment and domestic duties.

Communism brought improvement for women by reducing early forced marriages, publicly condemning wife-beating, providing free childcare, and recognizing the economic value of housework. Legislation, together with women’s prolonged contribution to the war effort, assisted in dismantling the absolute authority of the Confucian “three submissions.” But with *doi moi*, it seems that the Communist Party has withdrawn from social engineering. Membership figures indicate that the Party is losing women’s support, with a drop in membership from 34% women in 1960 to only 16% today. Most women enjoy the rediscovered freedom of wearing nice and individual clothes and putting on makeup. In the heydays of Communist rule, these fashions were badly received, as this newspaper excerpt shows:

You young people, I know you need make-up to be beautiful . . . but you should also keep the Vietnamese manner; simplicity, purity and wholesomeness are beauty. It is advisable not to imitate the alien “styles” imported from the

European capitalist countries, and you see, these styles could really reflect only the lowly liking and crazy, care-free and pessimistic moods. A girl living in such a wholesome social situation as you are in now is advised not to wear such a queer and carefree hairstyle. And such thin, tight and revealing clothes as you are wearing now, in our North, all the decent, cultured women have never cared to wear. (*Vietnamese Woman* No. 293, May 1972, 6)

### War and the Influence of Western Civilization

In the northern areas controlled by the non-Communist side prior to 1975, the authorities did not carry out a policy systematically hostile to Confucianism. But disruption of the old social framework because of war, which forced people to abandon their villages for urban areas, as well as the impact of new living conditions and broader contact with Western civilization, also loosened traditional family ties. Children became more independent from their parents and the former strict obedience to the elders diminished.

Since 1986, the same changes were occurring in the Socialist Republic of Vietnam because of the influence of the official policy of a free-market economy. The ideals of consuming and having fun through buying goods are especially attractive to the younger generation, which is also the vast majority of the Vietnamese, 80% of whom are under 40 years of age. Pelzer White (1993) concluded that the beauty contests and calendars now sanctioned by the Communist state as a signal to the international business community that Vietnam is open for business, also convey a visual message supporting social change.

### B. Character of Ethnic Values

#### The Concept of “Phuc Duc”

The single most specific Vietnamese concept that exerts influence on the gender roles of men and women seems to be the concept of *phuc duc* or “merit-virtue,” a kind of karma concept. It refers to the merit that, in a former life, oneself and/or an ancestor acquired through virtuous deeds that is then passed on to succeeding generations, and the merit that a member of the present generation passes to future generations as yet unborn. It is “quantifiable,” as in “a lot of *phuc duc*.”

Based on the manner in which one lives one’s life, it can be an evil force (*vo phuc*) as well as a benevolent one. It is considered influential over a span of five generations. Thus, the nature of one’s *phuc duc*, together with the horoscope and geomancy, which reads the composition of *am* (*yin*) and *dong* (*yang*) in the earth, determines the course of life. The individual can exert only a limited personal influence. The definition of what is regarded as a virtuous life follows the Buddhist-Confucian code. The specific Vietnamese interpretation goes back at least to the 15th century and can be found in the poem, *Gia Huan Ca*. It is interesting to note that the primary determinant is not the act itself, but the motivation beneath the act.

Slote (1998) presented an example of how *phuc duc* works with *Kieu*, the hero in the epic poem, *Kim Van Kieu*:

She is a girl of particular charm, beauty, accomplishment, and morality, who sells herself as a minor wife to an unscrupulous scholar in order to redeem her father who has been beset by ill fortune. The scholar, a man devoid of virtue, turns out to be the husband of the madame of a brothel and *Kieu* is forced into prostitution. Under these circumstances, *Kieu*’s sacrificial act brings much *phuc duc*. On the other hand, were she to have become a prostitute for profit alone, she would have been condemned, her family would have suffered, and future generations would have borne the penalties. In a parallel sense *Kieu*’s misfortune

inasmuch as her life had been thoroughly virtuous, could be ascribed to bad *phuc duc* visited upon her because of transgressions of some ancestor.

Coupled with the nature of the motivation that serves to precipitate the act is the issue of sacrifice. An act that is performed easily brings far less reward than an equivalent action that is difficult and involves suffering. Since it was very difficult to bear the life in a brothel for Kieu, she was finally reunited with the man she loved, to whom she had originally been betrothed.

Based on the belief that “merit virtue is caused by the maternal,” women can create destiny. Deserving women of good conduct bring felicity to their descendants, just as tragedy, poverty, and other incidents of bad fortune can be blamed on one’s wife, mother, or grandmother. So important was (and still is) this concept, that although the wealth and status of a bride’s family matters, it is secondary to her *phuc duc*. A poor but virtuous woman of good heritage and blessed at birth by the heavens, who would increase the family’s fortune and ultimate destiny, would be a most desirable bride. And when a marriage is arranged between a poor but virtuous girl and the son of a wealthy family, the girl’s family also usually benefits. To a great extent, *phuc duc* has been influential in making the class system less stringent than in other cultures.

With the responsibility of acquiring *phuc duc*, a double standard has been created: Men, if they chose, were relatively free to act in ways that are scarcely designed to build *phuc duc*. Examples are gambling, cheating, and whoring. On the other hand, there were also the elderly men referred to as living saints, a position that carried great esteem because it contributes to the building of *phuc duc* for the family. As Slote (1998) observed, the very concept of *phuc duc* may lead to manipulation, because it can be used as a metaphor in the service of many emotions: hostility, competitiveness, defiance, self-sacrifice, guilt, and control. It is also a justification when all else fails, when the children misbehave, or when one is beset by misfortune.

#### *Astrology and the Influence of the “Thay Boi”*

Another very strong influence on sexual behavior is the belief that the specific constellation of stars at the time of one’s birth can reveal one’s destiny. The *thay boi* (the mostly female fortune teller) is the first resource to consult if something goes wrong. A good example of *thay boi* influence is the following statement of a 30-year-old transvestite (Bao, Long, & Taylor 1998, 20):

In my childhood when my father was alive, he forced me to wear shorts, but I did not and he fought me. My mother resorted to the fortune teller and knew that was my fate. It means that she must have such a child, no one expected that. My father who was a government officer felt shy and did not agree and said “the male should be male and the female should be female.” My mother could not stand it and said to my father you could not fight me any more. If you fight him I will leave. She said to my father you can not prevent him from that and finally he accepted me. I have always been like this when I was growing up. All my relatives did not accept me. I think that is my fate. What problems I suffer because I can’t wear male clothes. I only wanted to be a girl.

One might suggest that the astrologer seems to be as important for Vietnamese society as sex therapists, psychologists, and marriage counselors are for Western societies. Even today, nearly two thirds of the couples in the south and (because of the stronger influence of communism in the north) a smaller part in the north have their horoscopes

matched before marriage (Goodkind 1996). Since geomancy is believed to reveal if the location of one’s house is the reason for quarreling in the family or even for sterility, asking a geomancer is also regarded as helpful. According to Young (1998), the third precise way to measure the energy believed to cause change in the fortune of any individual is to study the shape of the person’s face. Although it cannot be changed by reading the face of others, one gains intimate knowledge about them.

#### *Alteration of the Genitals*

Khuat Thu Hong (1998) mentions that some men, especially male prostitutes, are undergoing the surgery of “putting pellets” (small, metal balls—usually two or three at a time, but some men have as many as nine or ten) or “swords” (the sword-like plastic pieces are punched through the penis) into their penis. The men argue that the altered penis creates special pleasure for women.

### 3. Knowledge and Education about Sexuality

Although Vietnam can be regarded as a fairly liberal society when it comes to sexual behavior, talking or writing about sexuality is a totally different matter. Vietnam never produced sex education books like the Indian *Kama Sutra* or the Chinese and Japanese pillow books. Most young people get married without the least elementary knowledge, as a collection of interviews in Khuat Thu Hong’s (1998) book shows:

On our wedding night, neither of us knew anything—meaning that we slept together as friends. We even tried to do something, but we didn’t know what we were doing (born 1959).

On my wedding day, I didn’t understand why when we slept with another, one person laid atop another. . . . I thought we were only supposed to lie side by side (born 1957).

After 1950, a few books on sexuality and sex education were published. Most prominent was Dr. Nguyen Manh Bong’s book, *What Lovers Should Know*, published by Huong Son Publishers in Hanoi in 1949. Similar publications appeared in the south of Vietnam during the succeeding years. In 1970, one Saigon newspaper ran a column called “Replying to Your Questions on Sexuality,” which was written by two psychologists. In the North, prior to *doi moi*, there were almost no publications on sexuality. In the 1970s, the sole publication on sex education was *Girl’s Hygiene*, which included quite sketchy information on female sexual organs, menstruation, and how to maintain personal hygiene. In 1988, David Reuben’s book, *Answering Those Questions You Don’t Dare Ask*, was translated from English and attracted much attention, but was banned from official circulation until 1989. Other books were translated from German, including Rudolf Neubert’s *Marital Relations*, published in 1989. In 1991, David Elia and Genevieve Doucet’s book, *1000 Questions and Answers About Women and Their Bodies*, was translated from French and published in Vietnam.

In recent years, many books by Vietnamese on sex and sexuality have begun to appear in bookstores. Ho Ngoc Dai’s 1991 book, *Chuyen Ay [That Conversation]*, which talked about sexuality within a philosophical and psychological framework, drew much attention. Books based on scientific knowledge are more common and include Doan Van Thong’s book, *Nhung Thac Mac Tham kin Cua Ban Tre [The Secret Questions of Young Friends]* published by Tien

Giang Publishers in 1991, and Minh Phuong's book, *Hoi Dap ve Gioi Tinh va Tinh Duc* [*Questions and Answers about Sex and Sexuality*], edited by Dr. Le Van Tri, published by Medical Publishers in 1995. Psychologist Dr. Pham Con Son has also written about love, sexuality, marriage, and family in books such as *Nhung Thu Dich Cua Hanh Phuc Lua Doi* [*The Foes of a Couple's Happiness*], published by Dong Thap Publishers in 1996. The Research Center for Gender, Family, and Environmental Development is the first social science research institute to begin writing books on sex and sexuality, including Dr. Dao Xuan Dung's book, *Gia Duc Tinh Duc* [*Sex Education*], published in 1996 by Youth Publishing House. In addition, there are series of other books written by local and foreign authors mainly from Russia, the Czech Republic, and Poland (Khuat Thu Hong 1998).

As Gammeltoft (1999) points out, many aspects of everyday life in Vietnam are politicized through governmental mass education and mass mobilization campaigns. In fields as diverse as diet, marriage, religion, and pregnancy, there are politically right and wrong answers to any question, and everyone knows precisely what is politically correct and socially desirable and what is not. This is particularly true for family planning issues, which have been given a very high priority on the government agenda since the late 1980s. There are efforts to educate people about sexual issues, as may be exemplified by this report:

One morning at the shrimp factory I watched as 700 women in identical white smocks cleaned the shrimp. Suddenly their work was interrupted—all had to stand and watch a video on AIDS prevention. Some cases had appeared in town, a manager told me. That night the scenes were the same in boomtown Nam Can. AIDS is just another risk of frontier living. (*National Geographic* February 1993, 35)

Sex education has been limited because of Vietnam's traditional bias against the public mention of anything sexual. Although this situation may seem similar to other countries, in Vietnam much of the opposition to "sex education" comes from administrators and teachers, of whom many are reportedly too embarrassed to discuss intimate sexual matters with the students. Faced with an increasing HIV-infection rate and an abortion rate thought to be among the highest in the world, Hanoi health officials opened the city's first sex education café in November 1999. The café fills a void in sex education, as the subject is not taught in schools, and many parents admit they are too embarrassed to raise the issue with teenage children who are becoming increasingly sexually active. The idea for the Hanoi café stemmed from a study that detailed how young people spend their time. It is also modeled on a similar initiative in Ho Chi Minh City. The café offers a place where young people can spend time talking with their friends and freely ask for information about sex and AIDS. Although the café will not distribute condoms, a female physician specializing in reproductive health, and an HIV/AIDS counselor are on hand to answer questions. On average, about 50 customers, ages 16 to 24, have visited the café on a daily basis (Watkin, *South China Morning Post* December 20, 1999).

In 2000, a pilot project sponsored by the United Nations Fund for Population Activities was started that allows high schools in eight of Vietnam's 61 provinces to offer advice on obtaining contraceptives at government clinics and pharmacies. Three thousand pharmacists in five provinces are being trained to provide customers with better information on contraceptives, and state-run radio airs a weekly show answering youths' sex-related queries (Cohen, *Far Eastern Economic Review*, 6/29).

As far as homosexuality is concerned, only in the last three years has a grassroots group emerged with the aim of reducing the spread of HIV/AIDS among gay and bisexual men in Ho Chi Minh City. The Nguyen Friendship Society consists of about 50 volunteers who prepare and print leaflets about sex education to be handed out to patrons in bars and clubs.

#### 4. Autoerotic Behaviors and Patterns

No information about autoerotic practices exists except for the French period. According to Jacobus X. (1898), masturbation occurred very often: "Nearly all the boys practice masturbation from the age of fourteen or fifteen years," but it seemed to him that it was practiced only by males:

This, no doubt, results from the ease with which the girl or woman can satisfy her natural desires; moreover, the great frequency of the "flowers" [an STD, probably gonorrhoea] must help to limit this special form of vice. I never met but two cases, and both of these were the mistresses of Europeans (Jacobus X. 1898).

#### 5. Interpersonal Heterosexual Behaviors

##### A. Talking About Sexuality

The Vietnamese prefer a flowery, euphemistic vocabulary when they speak about sexuality. For example, a man having sexual desires might say, "I am going to buy a tree." Food is also heavily connected with sexual activity. Words like "crisp, sticky, spicy" are used to describe food as well as women and are frequent in erotic fantasies. Many dishes are identified with female figures or organs: The white rice flour cake is the image of a virgin; the pulpy interior of a breadfruit with its sticky juice is associated with the vagina; the eating of a rice flour pancake is similar to the defloration rite; the sucking of the honey flambéed banana and the scooping of water in the rice field are symbols of having sex. As in many Asian countries, this type of language helps people to speak about sexual matters without using the terms that would embarrass them.

##### B. Sexual Behaviors

###### *Kissing and Sex Positions*

In traditional Vietnam, kissing in the "Western" sense was forbidden. Instead, nose sniffing or rubbing, comparable with Inuit customs, was practiced. The preferred position for sexual intercourse among the Vietnamese was both partners lying face-to-face, side-by-side, or the rear-entry position. The reason for these preferences, Jacobus X. (1898) suggests, is the structure of the Vietnamese bed, which is made of bamboo slats. In the missionary position, which he calls *la position de l'amour classique*, a man would scrape the skin off his knees.

###### *Premarital Relations, Courtship, and Dating*

The information one can gather about the beliefs and practices of young people regarding premarital relations and the role of sexuality are quite contradictory and are evidence that sex research is still underdeveloped in Vietnam. For example, the Departments of Psychology and Sociology of Hanoi University conducted research in 1992 on the sexual relations of university and high school students in Hanoi (Hoang Ba Thinh 1992). About 72.4% of female students in their fourth year of university had sexual relations, with only 17.6% having had one (usually their first) partner, whereas the others had between two and four partners. Yet, after graduating, only 8.2% of respondents had married one of these partners. Among those female students who had boyfriends, it was quite common for them to live together in the

dormitories. An early 1990s survey by CARE (Cooperative for American Relief Everywhere) found that just over half of Vietnamese men had had two or more sexual partners in the previous two weeks (Franklin 1993).

In a recent survey, only 34% of students in Ho Chi Minh City responded that they found premarital sex "acceptable." Although not considered high by international standards, the statistic was shocking to most Vietnamese. A socially more acceptable figure was that only 10.3% of men and 1.4% of women had had sexual intercourse before their marriage, and 57.5% said they did not plan to have sex before marriage, whereas only 14.7% replied that they did plan to have sex before marriage (Chittick 1997).

O'Harrow (1995) reports that premarital intercourse is quite common in Vietnamese villages, but also that there is still an obligation on the man's part to marry the girl he has deflowered, and she reminds him of this fact in the strongest possible terms. Young couples in Hanoi, even married couples, face great difficulty in finding a place for private encounters. The evening stroller through the city's lakeside public parks must step carefully to avoid interrupting lovers hard at work.

### *Marriage and Family*

In the past, Vietnamese marriages were arranged through matrimonial agents (*mai-dongs*) who brought the two families together and arranged the question of the wedding portion (brideprice). Interestingly, the woman did not bring any marriage portion, and it was the groom who paid for the wedding presents, brought to the common lot his fortune of rice fields and cattle, and often had to pay money to the wife's family. In return, his compensation was comparatively small: a tobacco jar, for example, a box for betel nuts, or a cigarette case. The wedding ceremony was quite simple: The future husband and wife met, mutually offered themselves to each other, and chewed betel nut together. Though Confucian tradition permits the husband to take lesser wives (theoretically to be chosen for him by the first wife), economic realities (and relatively innocuous modern laws) would force him to be content with one at a time. O'Harrow (1995) reports also that to give a woman a piece of fine jewelry in the Vietnamese tradition is to help confirm her independence as a human being, and for a mother to hand over a piece of her jewelry to her daughter is a universally understood gesture, for which the subtext is "may this protect you from misery." Nowadays, divorce is increasingly easy to obtain.

### *Adultery*

A quite questionable story found in different sources dating back to the 19th century is that a woman found guilty of adultery would be thrown to a specially trained elephant, which in turn threw her into the air with his trunk and trampled her to death when she landed. Quite telling is the gusto with which this story was spread by European authors.

The early *Annamite Code* contained the following article: "An adulteress shall receive ninety blows of the rattan upon her buttocks, and her husband may afterwards marry her to another, or sell her if he pleases, or keep her in his house." Jacobus X. (1898) quotes *Le Code*: "Shop men who commit adultery with the wife of their master shall be treated as servants or slaves, and punished by strangulation."

As O'Harrow (1995) shows, moral values in Vietnamese society are enforced by constraints of shame rather than guilt. A Vietnamese woman can cheat (in the Western sense) on her husband without regret, as long as it is not known. The following saying illustrates the point: "Flirtations with desire, I wore a wedding ring for protection; I lost my wedding

ring, but my desire remains." Vietnamese men, in their turn, know the "rules of the game" and have less of a tendency than women to brag publicly about their conquests.

It seems that the younger generation in particular, which grew up during *doi moi*, tends to excuse adultery. Unhappiness in marriage, being sexually unfulfilled, or just being attracted by another person are now regarded as legitimate reasons to have sexual contact with another person other than one's partner (Khuat Thu Hong 1998).

According to Fahey (1998), middle-class urban women often confide during informal interviews that their husbands have a mistress or entertain several girlfriends. Because women are still responsible for family finances and the welfare of children, it is common for them to have secret savings as a buffer against their husband's indiscretions with other women.

### *Incidence of Oral and Anal Sex*

Jacobus X. (1898) described oral sex as a way to avoid infection with a venereal disease. Apparently, it is not a very successful method, as he later writes: "I have found eruptions, ulcerations, and the scars of chancres, on the lips and tongue of the unhappy victims of this form of debauchery. When once they are affected, they in turn help to spread the syphilitic virus, by a law of reciprocity which it would be very difficult to repress." This was confirmed by the French surgeon Joyeux (1930).

Anal sex seems to have been far more common as a homosexual practice than among heterosexual couples. Jacobus X. (1898) suggests that it was a phenomenon that only occurred between prostitutes and their customers: "The woman is old when she takes to sodomy, which she does rather from economic motives, on account of the money it brings, than from natural taste."

## *6. Homoerotic, Homosexual, and Bisexual Behaviors*

### **A. Contemporary Practices**

In Vietnam, there has historically been relatively little male homosexuality, although a few of the emperors of the 16th and 17th centuries did maintain male concubines. In present-day Vietnam, homosexuality is still regarded as being a foreign problem, and, as in other socialist countries, there is a lack of official research on homosexual behavior. In fact, homosexuality is quite a common sexual behavior. It may well be that the Communist state is reluctant to recognize its existence. As long as it is not practiced "openly," state officials will not interfere. This is evident in the 1998 case of a lesbian couple who married in public. Because of the public ceremony, Vietnamese authorities were forced to act, even though they did not know how to deal with the couple:

Two women were wed in Vinh Long province (about 70 kilometers from Ho Chi Minh City). Hundreds of people, including friends, family members and a number of curious onlookers attended the ceremony on Saturday to celebrate the marriage of a 30-year-old woman to another woman aged about 20. Local authorities did not know how to react to the marriage (*Lao Dong* [Newspaper] March 8, 1998).

Two months later, the government reacted:

Government officials have broken up the country's first known lesbian marriage and extracted a promise from the lovers they will never live together. Twenty officials from various Communist Party groups met the couple for three hours at their home in the Mekong Delta town of Vinh

Long. They were acting on instructions of the Justice Ministry in Hanoi “to put an end to the marriage,” the *Thanh Nien* newspaper reported. It is unclear what kind of persuasion was used to get the couple’s agreement or what punishment they could face if they change their minds, but they signed a document promising not to live together, the justice official said. “They would have had no trouble with their relationship if they had not chosen to have a public wedding,” a member of the provincial justice department said. The issue was raised at the most recent session of the National Assembly during debate on amendments to the law. There were many other homosexual women living together in the province but Hong Kim Huong, 30, and Cao Tien Duyen, 23, were the only ones who were married publicly, he said. He said the wedding was an unwelcome challenge to traditional sensibilities and public morality but added: “As long as they don’t wed publicly they are left in peace.” (Reuters May 23, 1998).

In 1997, the same newspaper launched a virulent critique of a marriage between two men in Ho Chi Minh City. The apparently lavish ceremony held in a big Saigon hotel provoked an avalanche of protests from residents. Other homosexual marriages have taken place in Vietnam in discrete ceremonies, but homosexuality remains taboo in the country, although it is not officially illegal.

Vietnam’s first gay wedding took place in Ho Chi Minh City. The two men celebrated their union at a local restaurant with over one hundred guests. Some authorities, however, were not in the mood to congratulate the grooms. “It should be publicly condemned,” said Nguyen Thi Thuong, vice-director of the city’s state-run Consulting Center for Love, Marriage and Families. “Public opinion does not support this.” The police are reported as saying that no laws exist which would enable them to punish the happy couple. The honeymooners could not be reached for comment (Reuters April 7, 1997).

Sexual encounters between male adolescents may be facilitated by socially sanctioned close physical contacts considered “normal” between males, such as holding hands and resting or sleeping close together in the same bed. As far as the prevailing sexual activities, mutual masturbation and fellatio, are concerned, there does not appear to be any strongly developed sense of playing a masculine or feminine sexual role of the kind as is often found in other societies where anal intercourse is more prevalent and the ultimate objective of homosexual encounters.

Proschan (1998) has reported that although “gay” might be the only English word some of his informants had known, they had embraced it as their own and imbued it with meanings that diverge from those of English-speakers elsewhere:

Vietnamese men today are fashioning diverse ways of living as men-who-love-men, drawing variously on endogenous traditions and identities as well as exogenous concepts and practices, combining and recombining them, and at the same time contesting both cultural conventions that would condemn homosexuality as incompatible with filial piety and metropolitan notions that would insist there is only one way to be authentically gay.

## B. Homosexuality Under French Rule

Jacobus X. (1898) interpreted homosexuality as a questionable behavior resulting from the Chinese cultural influence, and a sign of decadence that disappeared after the French influence gained influence. If it was practiced by the French, he claimed, it was only to escape the dangers of

syphilitic female prostitutes. Interestingly, he does not discuss the interdependency between male prostitution and homosexuality. According to him, the customers in this era were Chinese and French, and the prostitutes Annamite boys:

It is only the nays and the boys who come in direct and permanent contact with the Europeans. Nay signifies “basket.” The nays are children of from seven to fifteen years, who are provided with round baskets. They are found on the quays, in the market, and in front of the shops, waiting for a customer to make a purchase of any kind. . . . It is from these baskets that the class of boys is recruited. These latter are from fifteen to twenty-five years of age [acting as valet]. . . . When once he [the nay with his basket in which he carries the goods] gets to your house, if he should suspect that you have depraved tastes, he will soon offer you his services: “Captain” (everybody was a captain in 1860) “me much know chewchew banana,” and if the client appeared to hesitate, “Me know ablic.” That is *sabir* (patois). The nay and the boy are generally, to use the Tardieu’s expression, “suckers of the dart.” . . . Whilst the European lies at full length on a long chair, or on his bed, the boy—kneeling or stooping—*inguina osculatur; sugit, emissumque semen in bucca recipit, usque ad ultimam guttam* [a kiss between the thighs, rise, ejaculate in the mouth of recipient, even to the ultimate].

Although by preference a “sucker of the dart,” the nay, or the boy, will not refuse sodomy, but he is not enthusiastic about it. It is not any moral reason which stops him, for he is above prejudices of that sort. It is simply the disproportion, which exists between the anus of a lad of ten or twelve years, and the penis of an adult European, for two nays have no objection to committing the act with one another. (Jacobus X. 1898)

## C. Homosexuality During the Vietnam War *Lesbianism*

According to Marnais (1967), who describes in detail male and female homosexuality, lesbianism could be found at all levels of society during the Vietnam War. There were three bars catering exclusively to lesbians, and lesbian marriages were also not uncommon in Saigon, obviously tolerated by a society that referred to such couples as “friends.” He interpreted lesbianism in Saigon as particularly rife among the city’s prostitutes. The so-called “bull dyke” lesbian did not exist, but there was a role division between the “Sugar Mommy” and the young girl who lived at her expense. In the late 1960s, the *Saigon Daily* news reported a case about a major lesbian “call-girl” operation catering mainly to wealthy female tourists from the West and to jaded Saigon society women. The organization was disbanded when there was proof of the involvement of girls under 15.

### *Male Homosexuality*

During the Vietnam War, much of Saigon’s organized homosexual activity revolved around the city’s “gay” bars. According to Marnais (1967), there were a total of 18 such establishments in existence during the late 1960s. Many of the customers could be found among middle-aged Saigon businessmen and teenage students. Only a small minority displayed the slightest effeminate trait. There were also homosexual steambaths, nightclubs, and coffee shops, and young boys, impoverished and orphaned by the war, sold themselves openly on street corners to passersby. There were at least four “call-boy” operations, catering mainly to wealthy Chinese businessmen and foreign (primarily French) residents. For American soldiers, it was risky to be involved in homosexual activity, because the army did not

tolerate it, and suspected homosexuals were immediately given a dishonorable discharge (Taylor 1997).

The only hint that the long years of living in the jungle and tunnels of the Ho Chi Minh Trail left traces in the specific sexual preferences of the Viet Cong can be found in the reports of journalists. According to Scholl-Latour (2000), most of the Viet Cong were so uninterested in women when Saigon finally fell that the female prostitutes did not appeal to them. But it seems far more probable that it was the strict discipline of the Viet Cong that prevented them from “fraternizing” with prostitutes.

#### D. Homosexuality and Vietnamese Law

Proshan (Aronson 1999; “Frank” 2000) writes that neither homosexual identity nor behaviors had ever been explicitly illegal in Vietnam. The ancient legal codes of the Le Dynasty (1428-1787) and the Nguyen Dynasty (1802-1945) detailed the penalties for crimes such as heterosexual rape, assault, adultery, and incest, but left homosexuality unmentioned. The only provisions in the codes that might refer to deviant sexuality were the prohibition against “men who wear weird or sorceress garments” (*Le Code*, Article 640; Nguyen & Ta 1987), and a prohibition of castration and self-castration (*Le Code*, Article 305; *Nguyen Code*, Article 344). Both provisions were not found in earlier Chinese codes. On the few occasions when homosexual activities seem to have been punished, they had been treated as rape or as adultery (disregarding the fact that both partners were the same sex, and concentrating instead on the fact that one or both were married to other partners). Vietnamese legal codes had always been strongly influenced by the Chinese codes of the same eras. In 1740, when the Ching Dynasty in China elaborated for the first time in Chinese history punishment for sodomy between consenting adults, the Vietnamese did not follow suit, once again omitting any such prohibitions in the *Nguyen Code* that was promulgated soon after. Nor did the French colonials institute explicit prohibitions against sodomy or pederasty in their colonies, because under the *Code Napoléon*, these acts did not fall under the purview of the legal system.

Although homosexuality or sodomy was not specifically referred to anywhere in modern Vietnamese criminal law, “sex buying and selling in any form” was prohibited, as were more-general and vague crimes such as “undermining public morality.” In the latest Law on Marriage and Family (1986), no article mentioned the State attitude or any guidelines for public opinion about homosexual behavior. The Penal Code did not mention homosexuality either in its articles on incest, rape, prostitution, sexual assault, or child marriage. But Vietnamese authorities could find legal basis for punishing homosexual behavior if they chose, because crimes such as “undermining public morality” could be used (as similar crimes of “public indecency” or “soliciting” are in the U.S.) to prosecute homosexuality.

#### E. Language and Homosexuality

The Vietnamese use more than one expression for the Western neologism *homosexuality*, although all have the same underlying meaning of “half man and half woman.” For example, *Dong Tinh Luyen Ai* is a literal translation via Chinese of “homosexuality,” which dates back to 1869. Its entry date into the Vietnamese language is not very clear. It did not appear in Dao Duy Anh’s *Han Viet Tu Dien* of 1931, but it did appear in his *Phap Viet Tu Dien* of 1936, and might have had limited currency in the journalistic vocabulary of the 1930s.

The concept of homosexuality only came into greater use with the introduction of Western psychology and sexology in

so-called hygiene manuals in the 1950s and 1960s. *Ai Nam Ai Nu* is the closest descriptive approximation to what is meant ontologically and behaviorally by the Western term *homosexuality*, though, if one takes *Ai* as a verb, the term comes closer to “bisexual” behavior. It did not come into use before the 1940s. Another variation on this term, which is more common in the biological and medical vocabulary, is *Ban Nam Ban Nu. Pe De*, for the French *pederaste*, is probably the most common byword for a gay person in Vietnam. It is urban in origin and can be dated to the French usage of the word. From the Chinese is borrowed *Ke Gian*, which is mostly used to depict anal intercourse, being thus is not limited to same-sex practice (“Vinh N.” 1999).

#### F. Sex Tourism

As publications like *The Men of Viet Nam: A Travel Guide to Gay Viet Nam* and websites like [www.utopia-asia.com](http://www.utopia-asia.com) suggest, foreign homosexual sex tourism is on the rise. Many Western visitors, who are called “Rice Queens,” leave behind everything they know about safe sex practices when they come to Vietnam. According to an estimate of the Nguyen Friendship Society, one third of Vietnamese men who have sex with foreigners do not use a condom, and may have never used a condom before.

### 7. Gender Diversity and Transgender Issues

Bao, Long, & Taylor (1998) report that a transgendered person in Vietnam is mainly a “man” who wears female clothes and presents himself as a female. *Bong cai* is the common term in the south and is translated literally as “female shadow,” whereas *dong co* is the common term in the north and is translated as “woman goes into a trance,” revealing its origin from the shamanistic tradition: The male *ong dong* or the female *ba dong* are shamanic mediums who incarnate a pantheon of spirits, both male and female, during the course of a *len dong* performance in one of the fortuneteller’s temples. They take on, in succession, the costume and comportment of the numerous spirits invoked, in what can be a daylong show of elaborate costumery. It seems that Vietnamese transgendered males only have sex with men, never with women or with other transgendered persons. Transgendered males refer to one another as “sisters” (*chi em*).

There are quite a few transvestites in Saigon who are trying to earn a living through prostitution. They look for customers in certain nightclubs and bars, as well as on the streets. Being a transvestite seems not to be something that is displayed in public, and the search for customers is done in an aggressive though feminine way.

Jacobus X. (1898) mentions transvestitism in connection with prostitution during the French period of Vietnam:

I cannot, however, pass over in silence, one eccentric form of the *lusus amoris*. The Chinese actors who play the women’s parts, come in their costumes [to the brothel], and assume the character of a modest virgin, afraid of losing her virginity, a refinement of vice which is much appreciated. In the presence of a number of old men, not very particular, the scenes of the first night of wedded life are represented without any shame.

Commenting on transvestite singers and transvestite striptease in the homosexual nightclubs of Saigon catering to male homosexual transvestites during the Vietnamese-American War, Marnais (1967) reported that transvestite prostitutes would congregate daily on the terrace of the Continental Hotel in Saigon. They were reported to have disappeared from view after the Communist takeover of

South Vietnam in 1975, but recent reports from the informants of Carrier, Nguyen, and Su (1997) returning from Saigon show that male transvestites can be seen on the streets once again, and some are again earning their income as prostitutes.

They may also make a living by joining a lottery team (*lo to*), often during adolescence, as singers. "Lottery team" refers to a mobile lottery team, who sell tickets and then spin for a prize at that establishment. The teams use singing to advertise (Bao, Long, & Taylor 1998).

## 8. Significant Unconventional Sexual Behaviors

### A. Coercive Sex

Coercive sex is prohibited in Vietnam. Article 112 of the Vietnamese Penal Code says:

1. Any person who uses force or any other means to have sexual intercourse with another person against his will shall be sentenced to imprisonment from 1 to 5 years. Any person who commits rape of a minor aged from 13 upward or a girl to whom he has the responsibility to give care and education or to provide medical treatment shall be sentenced to imprisonment from 2 to 7 years.
2. Any person who commits a crime in one of the following cases shall be sentenced to imprisonment from 5 to 15 years:
  - a. Organized rape or rape that does serious harm to the victim's health
  - b. Rape of many persons or creation of serious harms to the victim's health
  - c. Relapse into former crime with more severity.
3. Any person who commits a crime which causes the death or the suicide of the victim or commits a crime in a specially serious circumstance shall be sentenced to imprisonment from 12 to 20 years, to life imprisonment or to death penalty.
4. Any cases of having sex with a child aged under 13 shall be regarded as committing a rape and the person in question shall be sentenced to imprisonment from 7 to 15 years. Any person who commits a crime belonging to one of the cases stipulated in items 2 and 3 of this article shall be sentenced to imprisonment from 12 to 20 years, to life imprisonment or to death penalty.

### Child Sexual Abuse and Pedophilia

Incestuous relations and child marriages, as well as early marriages, are prohibited by the Penal Code in Articles 112, 146, and 145. Although reliable statistical data are not available, it seems quite certain that the number of juvenile prostitutes has increased rather quickly in recent years. Based on the ratio of age range of prostitutes provided by the Nam Ha province, it is known that among 164 prostitutes, 17.6% of them are in the 13-to-16-year age group and 19.5% are in the 16-to-18-year age group. Together, there are 37.4% in the 13-to-19-year age group. Another research document on prostitution in Ho Chi Minh City shows that in 1989, juvenile prostitutes accounted for 2.1% of the total number of prostitutes; in 1990, the rate was 5.2%, and in 1995, it was as high as 15% (Hoang Ba & Pham Kim Ngoc 1996). The United Nations Children's Fund (UNICEF) had a 1995 estimate that there were 40,000 child sex workers throughout Vietnam.

Jacobus X. (1898) records a variety of proverbial sayings common in French-dominated Vietnam of the 19th century: "For a girl to be still a virgin at ten years old, she must have neither brothers nor fathers." The same author reports on pedophilia:

... whilst he is a *nay* [a boy who is carrying a "basket" for a customer], he has not usually reached the age of puberty. As may easily be imagined, these poor little wretches fall into the hands of "active" pederasts, who are not remarkable for gentleness and kindness, and who brutally assuage their lewd passions without caring what may be the result. I have often found, in these unfortunate *nays*, marks of attempts that have been committed almost by violence, the fact being that a lad not yet arrived at puberty, and frail and weak, is incapable of making any serious resistance to brutal attempts at sodomy on the part of an adult European or Asiatic. (Jacobus X. 1898)

During the Vietnam War, sex with children and incestuous sex was frequently connected with prostitution. Marnais (1967) reported that it was possible to watch live sex shows with teenage twins and also hire them for sex. In a Saigon brothel called the "Doll House," over 50 girls, none older than 12, served the clients for sadomasochistic games. In the "House of Pain," very young girls got injections of heroin to make them physically and psychologically dependent.

### Rape

There exist few statistics about sexual abuse, and they are not very reliable. It is, for instance, quite questionable when Hoang Ba and Pham Kim Ngoc (1996) state that before the 1990s, only 400 cases of rape of women and children had occurred in the whole country in one year:

From January 1993 to July 1995, 1,685 cases of rape (324 cases being of children) occurred. Compared with the years prior to 1990, cases of child raping only accounted for 4 to 6% of the total, but in the past three years, this rate has increased. Concretely speaking, in 1993 rapes of children accounted for 14.6%, in 1994 16.6% and in the first months of 1995, the rate reached as high as 30%. The victims were young girls in the age group 10-13 but there were also cases of raping little girls aged only 4-5. In Ho Chi Minh City in 1994, 55 rapes of children occurred out of a total of 107 cases. 43 of them were under 13 (Hoang Ba & Pham Kim Ngoc 1996).

### Incest

As O'Harrow (1995) remarked, the vocative system of the Vietnamese language is largely devoid of pronouns and uses, relying instead on static kinship terms. Thus, in Vietnamese, a husband and wife enjoy a fictive incest. The husband speaks to his wife using the same terms he has always used towards his real younger sisters, referring to himself as "older brother" (*anh*) and calling his wife "little sister" (*em*). Also, a very peculiar incest taboo is found in Vietnam: It is forbidden for a Buddhist student to marry the widow of his teacher (Gregersen 1996). The traditional punishment for incest was strangulation of the offender.

### B. Prostitution

#### Prostitution in the Pre-Colonial Era

Jacobus X. (1898) reported that prostitution was very common during the 19th century. He distinguished between the Annamite "Bamboo," the Chinese brothel, and the "Flower Boats," the Annamite "Daylight Whore" and the Annamite "Mistress of the European." These girls were either sold by their poor parents or even kidnapped by professional girl traders. It seems that the Annamite "Bamboo" was the brothel for the natives and the lower social layers of the French colonials. The prostitutes were Vietnamese girls who had to wait for customers in bamboo huts, hence the name. The infection rate with STDs was high, and the standard of hygiene quite low. Jacobus X. (1898) mentioned black lacquered teeth (a Chinese fashion) and hairless

pubes as ethnic peculiarities. The girls had to sell themselves for very little money, and most of the money went to the pimp.

He also described the style of living of Chinese prostitutes, who first came from Singapore. They resided in big houses and waited on the verandas for clients. An elder woman acted as "mama." On the first floor were a lot of Chinese beds with dark-colored mosquito curtains to conceal the couples. For waiting opium-smokers, there would be a pipe. Although few of the girls smoked, they were instructed in preparing the pipes. The owners of the brothels and flower boats, which are houseboats in the channels, worked without license, and were free to carry on their trade. However, they had to put up with the extortion of the Mandarins. Under the most trivial presumption of harboring criminals, their inhabitants might be mercilessly driven out. Interestingly, the Chinese prostitutes had a chance to become a concubine of a man of reputation, and then rise to a more honored position. The houses of prostitution of Cholon were almost exclusively reserved for the Chinese and resembled the "society houses" in Europe. They were quite luxurious, with salons, divans, sofas, mirrors, and pictures.

Besides these brothels, there also existed the so-called "Daylight Whore" and the system of the mistress. Apparently, the first was formerly in the bamboo but left because of her age. She also had a *souteneur*, who protected her from the police officers. They lingered in the streets and around restaurants, waiting to contact some possible client. After the initial contact was made, they followed the client to his house, ready to suggest sodomy and the kneeling instead of the horizontal position.

The mistress of the European was often bought directly from the parents "for some 20 piasters," a young girl of 15 or 16, selected from those whose fate it would ultimately be to be sent to the "bamboo." It was quite common, though, to take the mistress of some friend or colleague who was leaving the colony, and thus get a woman "who has had some training, requires no outfit, and understands a little French." To prevent the mistress from "going wrong," Jacobus X. (1898) suggested setting his own Annamite boy over her as bodyguard.

### Official French Policy Towards Prostitution

According to Troung (1990) who quoted the report of the Commission of Enquiry of the League of Nations (1933), French colonial policy adhered to the International Convention for the Suppression of the White Slave Traffic of 1910, but did not accede to the International Convention for the Suppression of the Traffic in Women and Children of 1921. The general policy pursued by the French government in Indochina was regulation, i.e., control through registration and supervision of brothels and women who were already prostitutes, and safeguarding women and girls from being induced by force or deceit into prostitution. The control of prostitution was entrusted to municipal and provincial authorities. The age of consent for registered prostitution was established at 18 years for Asians and 21 years for Europeans. The police registered a prostitute if she was found soliciting in the streets or if a person complained of having been "contaminated" by her. In 1926, about 24 licensed brothels paid taxes every month to the Hanoi city administration in addition to the hotels and lodging houses that secretly harbored prostitution. In 1935, H. Virgitti, mayor of Hanoi, disclosed that there were about 4,000 people working in the sex industry, not including geishas and dancers (Khuat Thu Hong 1998).

It is interesting to note that traffic in women was considered by the French colonial administration a problem solely

connected with Asian traditions and customs. The 1929 report of the police prosecutor at the Court of Appeal in Saigon cited the following example of this quite hypocritical attitude towards the Vietnamese and the belief in the colonial authorities' own superiority:

It may be that the supervision exercised, the severe sentences by the courts and the administrative measures taken against foreign Asiatics sentenced for offences of this nature, have warned delinquent people against the consequences of this shameful commerce; it may be that the mental attitude modified through French influence and through contact with our civilization, so respectful of the rights of women and children, has brought about an almost complete change of the native customs (Commission of Enquiry of the League of Nations 1933, 218).

The French believed that licensed brothels were a far more humane and civilized treatment of prostitutes who were assumed to have entered the profession deliberately, even though the conditions were quite unbearable because of extreme exploitation. Medical officers sometimes sent girls to hospital not because of venereal diseases, but because they were in a state of "very great exhaustion, having been obliged by the keepers of the house to receive an excessive number of customers" (Commission of Enquiry of the League of Nations 1933, 217).

As in other colonies, Vietnam had a double standard. The few white prostitutes possessed certain rights; they could, for example, institute legal procedures against *souteneurs* of French nationality, and the men were invariably punished and expelled (Commission of Enquiry of the League of Nations 1933, 215-217). Because of the ideas of the Social Purity movement, prostitution was regarded as evil. Because the aim was not to analyze the social and economic reasons for prostitution, prostitutes became criminalized, in contrast to their customers.

The French also used *Bordels Mobile de Campagne*, huge trailer trucks converted into mobile field brothels with ten women to each truck. The *Bordels Mobile* traveled to every fighting front. When on leave in Hanoi or Saigon, the French soldiers preferred non-military-organized establishments.

### Vietnam War Period

According to Khuat Thu Hong (1998), archive materials indicate that in 1954 in Hanoi alone, there were around 12,000 professional prostitutes working in 45 brothels and 55 cabaret houses of whom over 6,000 were licensed. After 1954, in northern Vietnam, prostitution was theoretically eliminated. Article 202 of the Criminal Code states that any sheltering, enticement, or inducement of prostitutes is an illegal act, and punishment will vary by degree of violation. Yet, every year, about 300 to 400 persons were discovered working in this trade.

Between 1959 and 1962, organized prostitution in the South was almost totally crushed by Madame Nhu, who closed down every brothel and heavily fined the owners. This changed after the Ngo Dinh Diem regime was overthrown in 1963. During the late 1960s, about 32 establishments in Saigon were houses of prostitution, ranging from modest apartments to elegant three-story establishments. A good deal of the sex business was in the hands of the Vietnamese underworld, like the "Yellow Pang Society." In the French as well as in the American period, the "Flower Boats" or sampans plied their trade. They were frequently family operations, with the daughter(s) working as prostitute(s) while the brothers pimped on dry land. Some of the larger junks, however, were professionally run, often by the Saigon underworld. Prior to 1975, statistics from the Minis-

try of Society of the Saigon government reported about 200,000 professional prostitutes. In Saigon alone in 1968, there were about 10,000 professional prostitutes. By 1974, the figure had reached 100,000.

During the Vietnam War, one million soldiers from the United States were stationed throughout Southeast Asia. Most of these host countries signed agreements to provide their services as "Rest and Recreation" centers for United States military and aid personnel. Their presence contributed to the proliferation of commercial sexual intercourse. Although the U.S. Army was not officially involved in providing sex workers to cover itself against congressional reaction at home, it is known that some of the brothels kept by the Vietnamese Government and the ARVIN (Army of Vietnam) were exclusively reserved for GIs. The first military brothel opened in 1966 in Pleiku in the central highlands. According to Marnais (1967), it was to be the model for other "recreation centers," including several within the Saigon area:

The Pleiku brothel has twenty rooms, whitewashed and pleasantly furnished. The girls are all carefully selected on the basis of good looks, personality and knowledge of English. (U.S. Army Intelligence also runs a security check on each girl to make sure she is not a Viet Cong agent out to pick up useful information from her trusting bedmates.) The girls are closely supervised by a matron under contract to the Pleiku Administrative Council. An American GI pays 300 piastres (\$2.50) for a ticket, allowing him up to three hours with any given girl. (Twosomes and other exotic sexual ménages are out.) Between 100 and 300 GIs visit the house each day, passing through a sandbagged guard post where they are required to show their ticket and have it stamped by a Vietnamese soldier. Fifteen percent of the girl's earnings are deducted to pay for expenses at the center, but a hard-working and a popular prostitute can earn between 8000 to 15,000 piastres (\$66 to \$125) a month, a good salary in today's Vietnam.

The main reason for the U.S. Army to provide those establishments was the alarmingly high venereal disease rate among U.S. enlisted men. However, most of the soldiers preferred to look for prostitutes themselves in bars catering to GIs.

A prostitute earned as much as \$180 per month. The average government civil servant earned roughly \$30 a month, and even cabinet ministers and Assembly members had fixed salaries of \$120. A special form of prostitution was the "mistress," i.e., a paid steady girlfriend. GIs considered this a "safer" alternative to the brothels and bar girls. There existed rumors about an incurable strain of syphilis, called "Black Clap," and Viet Cong girls who were able to put razor blades into their vaginas to castrate or even kill clients (Gulzow & Mitchell 1980). The latter rumor is without doubt a reflection of the ability of some trained girls to use their vaginas to smoke cigarettes, shoot arrows, or to put razor blades or other sharp materials in them without getting hurt.

While under French rule, marriages of French soldiers and Vietnamese women were prohibited. American soldiers, on the other hand, could marry. A U.S. Army study of 64 GIs who had filed applications to marry Vietnamese girls between June 1964 and November 1966 concluded that a high proportion of GIs who married Vietnamese women were divorced, sexually inhibited, fearful of American women, or disenchanted with some aspects of American life (Marnais 1967).

### *The Present*

After the Viet Cong occupation of Saigon, the new government tried to eliminate prostitution by closing brothels

and sending prostitutes to work or to so-called reeducation centers. Between 1975 and 1985, 14,304 prostitutes in Ho Chi Minh City were sent to those centers. The Government claimed that prostitution was eradicated in the South by 1985. But as Stephanie Fahey (1998) remarked: "In a country where the Communist Party attempted to eradicate prostitution and pornography, prostitutes are now found in almost every bar, restaurant and hotel whether private or state-owned." According to statistics from the Department of Criminal Police, Ministry of the Interior, in the first six months of 1990, Vietnam had 40,000 prostitutes and 1,000 brothels. By the first six months of 1993, there were 200,000 prostitutes and 2,000 brothels. A report prepared by SCF (Save the Children Fund) in 1995 estimated that there were 149 brothels in Ho Chi Minh City alone. Many of the establishments are, officially, bars selling beer to Vietnamese clients. According to one recent unofficial estimate (Khuat Thu Hong 1998), there may be half a million sex workers in all of Vietnam, not including the increasing number of male prostitutes in the southern provinces and the big northern cities. Government Resolutions 53, 87, and 88, passed in 1994 and 1995, strengthen management over cultural activities and monitor the struggle against the so-called social evils, including prostitution, gambling, and drug use.

The reasons for women to become sex workers remain the same as during the Vietnam War and in other developing countries where there are few opportunities in rural areas and low wages in the jobs open for uneducated girls. Poverty is not the sole reason pushing women into prostitution. Family conflicts and their feeling of hopelessness about their husbands or boyfriends are also important reasons. The women interviewed by Cooper and Hanson (1998) stated that they were much better off now than in their villages. Although prostitution is illegal in Vietnam, because of economic problems, it is again becoming the booming business it was during the Vietnam War. But tourists report that because of corruption, the interpretation of the law is quite broad. Some of the girls who are looking for customers and are talking to tourists are agent provocateurs for corrupt policemen who force the foreigner to pay large sums to "avoid an incident." On the other hand, there are also police actions to clean up streets and districts with known prostitution, as Cooper and Hanson (1998) were told by a madam.

Prostitutes can be found on the street, sometimes with a pimp in the background, in massage parlors, and nightclubs. Two types of social networks are most common in the sex workers: peer and friend relations. They often work together in groups of two to five at a site, and this site remains fixed for a number of prostitutes for an extended period of time, from several months to a year or two. Many prostitutes are organized in groups for protection, or they may become friends. As a result of these social groupings, newcomers may be bullied by older prostitutes. They often make friends with a man who is referred to as their "boyfriend" (*bo ruot*). He may be a familiar client or a man who lives with the prostitute in a hired room and can protect her during work. Prostitutes have sexual relations with clients, boyfriends, and husbands. The average number of sexual contacts of the ten prostitutes interviewed by Bao, Long, and Taylor (1998) was 23 per month, some having 40 or 50.

### *Clients of Prostitutes*

Clients of sex workers are called *Khach lang choi* in Vietnamese. According to the study by Bao, Long, and Taylor (1998), all social classes, with the exception of farmers, can be found among them: workers, truck drivers, students, engineers, married, and unmarried men. The clients often start off going to a *beer hug bar* or restaurant to drink beer

where they end up negotiating sex with one of the beer hug girls. Or they drink beer or alcohol first at one place and then go to another place to seek sex.

As in other developing countries, sex tourism is a growing business. Although reliable statistics are not available, such indicators as websites with advice for international tourists show a tremendous increase of travelers interested in sex, especially because Vietnam wrongly has the reputation of being "safer" with regard to STDs and AIDS than other countries in Southeast Asia. Because by law, Vietnamese citizens are prohibited from going into a hotel room of a tourist unless they are registered guests, prostitutes and customers meet at small Vietnamese-owned mini-hotels that cater to the locals and tolerate prostitution.

### Healthcare

Since the early 1990s, the New Zealand Prostitutes Collective has worked together with the Save the Children Fund in providing peer-training workshops for sex workers. According to the SCF official report of 1995:

Peer educators and peer counselors serve as credible and impactful disseminators of preventive/protective knowledge and behavior skills, and as positively reinforcing role models and change agents in the referent target populations (including sex workers). (p. 4)

On the street, an outreach worker reported to Cooper and Hanson (1998) that there is at the start always some mistrust when they try to bring women for an STD checkup, but with developing relationships, the women are glad that someone looks after them.

### Sexual Slavery

According to Article 115 of the Penal Code, any person who buys and sells women shall be sentenced to imprisonment from 5 to 7 years. Any person who engages in this kind of behavior with an organization, takes the woman abroad, buys or sells many women, or relapses into this crime shall be sentenced to 5 to 20 years in prison.

According to news in the *South China Morning Post* (July 29, 1999), domestic sexual slavery is increasing, with an estimated 20% of Vietnam's commercial sex workers held in brothels against their will. In Vietnam, women can be sold to brothels for two million dong (HK\$1,120), but according to the Ministry of Labor, brothels in Taiwan and China pay up to US\$7,000 (HK\$54,250) for young Vietnamese women. Therefore, it is no wonder that Vietnam is becoming an important source of women destined for sexual slavery in Hong Kong, Macao, and Southeast Asia. Many victims are lured into marriages with foreigners and migrate with their new husbands before being sold to brothels.

### C. Pornography and Erotica

Jacobus X. (1898) reported that in the second half of the 19th century, Chinese merchants were famous for selling Chinese and Japanese phalli (dildos) and the colored albums of Chinese erotica. At first, the merchants had quite a bad reputation, but this changed gradually, with the merchants becoming esteemed for their business.

During the Vietnam War, the main sources for pornographic photographs were the black market moneychangers who always had some pictures to sell to GIs. The Tu Do Street was the main center to purchase pornographic material, according to Marnais (1967). During the early 1960s, the only pornographic pictures and books available in the city were imports from Hong Kong and Bangkok, where little cartoon folios, pornographic poems, and photographs were turned out by the hundreds of thousands. By 1967, with the influx of GIs, the market had grown, and a group of

domestic entrepreneurs has sprung up to take advantage of it. Pornographic paperbacks, featuring young Vietnamese girls and boys sold along the "Rue Cat," were printed on Saigon's presses.

The "blue" movie houses were located on the same street in little rooms above shops or bars, and the locations fluctuated frequently to keep the authorities away. The windows were painted black or covered with heavy curtains. The movies usually showed a young woman waking up in her small room, taking off her few clothes, starting to masturbate with some kind of dildo or fruit, and ending with a male or female visitor to her room having intercourse with her. As in the 1960s, they were usually short 16-mm films, mostly in black and white and without sound; some were more expensively produced in color, some with threesomes or bestiality. In the background of the rooms were prostitutes waiting for potential customers, most of whom were Westerners. Prostitutes also used pornographic pictures and movies to get their clients "in the mood." European pornographic films existed for homosexuals. Although pornography is forbidden today, according to Stephanie Fahey (1998), government research institutes are known to import pornographic magazines for resale.

## 9. Contraception, Abortion, and Population Planning

### A. Vietnam's Family Planning Policy

The Vietnamese family planning program has its roots in the early 1960s, when some contraceptive methods became available in both the southern and northern regions on a limited basis. Beginning in 1962 in the northern province, the government planning policy was directed to reducing the rate of population growth, and the use of certain relatively permanent contraceptive methods, such as the IUD, was promoted. Until the 1970s, however, a governmental policy was not formally implemented. The family planning program in the southern province began in the late 1960s, largely in response to concern over maternal and infant mortality and the increasing number of illegal abortions. In the mid-1970s, the Government of the Republic of South Vietnam stated that family planning had been adopted as an official policy, but inadequate medical facilities made it impossible to implement an effective family planning program.

The Committee for Population and Family Planning (CPFP) was established during the early 1980s, and a one- or two-child policy was formally initiated in late 1988. At about the same time, Vietnam introduced comprehensive free-market reforms, which increased the effectiveness of the population program. The program included an extensive media campaign, free provision of contraceptive services and devices, and the creation of incentives and disincentives to encourage compliance. With a government target to reduce the total fertility rate to 3.0 births per woman by the year 2000, the fertility rate had already fallen to 3.1 by 1994. The sharp drop in Vietnam's fertility over the past several years, which has attracted global attention, can be linked to the general context of how family planning is delivered—including penalties for family planning violation, and to the widespread use of modern contraceptive methods and abortion. The intrauterine device (IUD) is by far the most popular contraceptive method, followed by traditional methods (withdrawal, "rhythm," and breastfeeding), increasing use of the condom, and the pill a distant last place.

### B. Increasing Condom Use

The condom was rarely used in Vietnam until recently, but both knowledge and use of the condom have increased significantly over the past ten years. Among married women

aged 15 to 49, knowledge of the condom rose from 45% in 1988 to 76% in 1994, and the use of the condom more than tripled from 1% in 1988 to 4% in 1994. The predominant contraceptive method, however, has been the IUD: In 1988, 33% of the respondents relied on the IUD (with neither a decrease nor increase in 1994). But the IUD is nevertheless known and feared for its side effects: heavy bleeding, infection of the ovaries, and severe abdominal pains, as well as very likely infection of the cervix, ectopic pregnancies, and a low effectiveness rate in general (Goodkind & Anh 1997). As Gammeltoft (1999) was told by a woman: "You know, in the old days, heaven decided how many children one would have. Today we have the IUD, so heaven still decides." One reason for failure and health problems may be that for a long time, the only IUDs available were used IUDs from Communist East Block countries. Some health providers also complain that the IUDs, which today are imported from the U.S., are too large for the uteruses of Vietnamese women. Most improbable seems to be the opinion of Women's Union cadres that "it is a disease of the mind," and that women simply blame all their troubles in life on the IUD.

According to Goodkind (1997), primary reliance on the IUD and abortion is typical of former Marxist states, which have tended to discourage supply-based methods, thus reflecting an indifference to consumer choice and an inability to afford these methods, or to keep tight reins on their distribution and use. Within Asia, Vietnam is distinguished by having the highest levels of IUD and abortion use in the region, perhaps partly because policymakers see this strategy as the most effective way to meet current fertility targets.

One reason for the rise in condom use is the increased availability of the product because of free-market reforms introduced in the mid-1980s. In combination with family planning promotion in the late 1980s, these reforms allowed for two channels of condom distribution: through the public health sector and sales through private pharmacies and family-owned roadside stalls. There are drawbacks, however, to obtaining condoms through public-sector centers, namely, the necessity to travel some distance to reach a center, the need to register one's name to receive supplies, and the necessity to use whatever brand of condom is being offered. But because condoms are offered free of charge, a growing number of condom users seems to prefer going through the private sector. In recent years, the growth of social marketing programs has increased the number of brands available and also competition, which has kept prices low.

The condom is more popular than the pill, both for spacing births and for preventing them. One reason for the greater popularity of the condom may be its greater compatibility with traditional methods, such as withdrawal. Data from the 1994 national Vietnam Inter-Censal Demographic Survey (VICDS), being both an inter-census demographic survey and a family planning survey, indicated that 31% of married women of reproductive age who switched from the condom to another method did prefer one or both traditional methods, rhythm or withdrawal, compared with only 24% of those women who switched from the pill. Given the high prevalence of traditional-method use in Vietnam—22% in 1994—these attitudinal dynamics seem to favor use of the condom over the pill. As Goodkind (1997) pointed out, the preference for condoms cannot be fully accounted for only by conventional explanations like the lesser compatibility of the pill with traditional methods, monetary concerns, or problems in pill supplies. In addition to these reasons, one might speculate that the national family planning leaders discouraged pill use, because they were skeptical that rural women could use it effectively. Also, the IUD and sterilization, even abortion, are being looked at much more favorably, because they re-

flect the socialist legacy of de-emphasizing consumer choice and ensuring compliance with the one- or two-child policy. Goodkind argued that enduring cultural factors, including its Confucian heritage, may also contribute to a preference for condoms over the pill. Vietnam exhibits the same family-formation characteristics as many other Confucian societies in East Asia: patrilineal family organization, son preference, lunar birth timing, and high rates of abortion. Preference of the condom may stem from traditional Chinese medical beliefs, which are intertwined with Confucian, Buddhist, and Daoist religious philosophies. These beliefs often emphasize the importance of maintaining a balance of natural body rhythms. The pill may thus be perceived as interfering with the menstrual cycle and disturbing the proper balance between "hot and cold" food intake.

### C. Socioeconomic Characteristics and Contraceptive Methods

The condom is the only method with a higher preference among urban users and among those with higher levels of educational and occupational status. In 1994, 10% of urban residents used condoms, compared with 4% of rural residents. However, women of all occupational statuses and educational levels overwhelmingly prefer the IUD and traditional methods, with the pill coming in a distant last place.

Goodkind (1997) suggested that because Vietnam is currently developing very rapidly, its population is becoming better educated, more affluent, and more urbanized. Economic reforms have contributed to a rising standard of living as well as to a growing disparity between rich and poor. These conditions have also increased the numbers of commercial sex workers and their patrons. Because of these social and demographic developments, one can expect the use of condoms to increase both for pregnancy and STD prevention outside marriage.

According to a recent but undated United Nations study, 40% of Vietnamese married men have had extramarital sex. Another survey conducted in 1993 showed that 69% of homosexual men and 38% of urban heterosexual men used condoms during their sexual encounters. Half of sex workers had not used a condom during their most recent sexual encounters (Goodkind 1997).

The decision to use condoms is partly a question of government efforts to improve knowledge and awareness of HIV and other STDs and how to prevent them. There are influential political groups, however, who assume that condoms encourage people to engage in premarital or extramarital sex; these groups object to the discussion and distribution of condoms. Others, like the Vietnam Women's Union, hold a more pragmatic view. They have recently prepared a publication about AIDS prevention that is targeted to young people.

Condom use will very likely continue to increase because:

- Family-size desires are still declining;
- Economic reforms and increased personal income have made condoms more accessible;
- Condoms are suitable to use with traditional methods;
- Current social mobility and migratory patterns are redistributing more Vietnamese into better educated, wealthier social groups; and
- Recent increases in adolescent and extramarital sexual activity, coupled with a growing concern over STD/AIDS prevention.

### D. The 1994 Vietnam Inter-Censal Demographic Survey (VICDS)

North Vietnam was among the first countries in the developing world to adopt an official policy to reduce popu-

lation growth. Following reunification, policies to reduce population growth received increasing political attention from the national government. In January 1993, the Communist Party Central Committee identified population growth as contributing to a wide range of social, economic, and ecological problems. A resolution endorsed the recommendation that each family should have only one or two children, so that fertility could be lowered and population stabilization achieved. In June 1993, the prime minister approved the "Population and Family Planning Strategy to the Year 2000," a comprehensive plan to guide the implementation of the resolution.

The 1994 Vietnam Inter-Censal Demographic Survey (VICDS) was conducted from April through June 1994 in a nationwide effort to obtain information about fertility, investigate the prior trend of fertility decline, and determine whether the decline is likely to continue. (An intercensal survey is a national survey conducted to obtain information not gathered in the regular national censuses.) Results revealed a substantial change over recent years in reproductive attitudes and behavior. Fertility has continued to decline to a level not far above three children per woman. Compared with the late 1980s, contraceptive knowledge has broadened and contraceptive use has increased. Stated family-size preferences have shifted noticeably downward. The findings also confirmed that urban women are characterized by far lower fertility than rural women, that the Red River Delta (which includes Hanoi) followed by the Southeast (Ho Chi Minh City) show the lowest fertility levels, and that the Central Highlands show the highest fertility rates. Finally, the survey documented that there is an inverse association between fertility levels and educational attainment: The fertility rate for each successively higher educational grouping is lower than for the previous grouping.

### E. Knowledge of Contraceptive Methods

By 1988, 94% of all married Vietnamese women were familiar with at least some methods of contraception, including at least one modern method; 90% of the married women were familiar with the IUD (Goodkind 1997). By 1994, a marked increase in familiarity with specific methods, both modern and traditional, was evident. About 75% of the women surveyed indicated awareness of the condom and both male and female sterilization, whereas 68% said they had heard about the pill. Reported contraceptive use was substantial and, according to the VICDS (1994), continued to increase between 1988 and 1994. About 73% of married women reported ever having practiced some form of contraception, compared with 60% in 1988. In 1997, according to the most recent Demographic and Health Survey of Vietnam (VN-DHS II), more than 84% of currently married women aged 15 to 49 have ever used a contraceptive method. The contraceptive prevalence rate (CPR) is 75%, and 56% of ever-married women are currently using a modern method. The total CPR is up by 10% over the level of the 1994 survey, and the use of modern methods rose by 12%, with traditional-method use falling by about 2% owing to less-frequent use of periodic abstinence. Compared with the 1988 DHS NCPFP, Vietnam Demographic and Health Survey, 1988 (Hanoi 1990), and 1994 VICDS, the contraceptive mix has not changed very much. About half of the reported increase was attributed to use of modern methods and half to increased use of traditional methods. As far as the "method mix" is concerned, two features stand out: the dominance of the IUD among modern methods, and the relatively high share of traditional methods. Current use of oral contraceptives is still very low, being used by 2% of married women.

### F. Abortion

In North Vietnam, since 1962, abortion on request (with the husband's consent) was available during the first trimester of pregnancy and was usually performed by vacuum curettage. Because of the 1933 decree enforcing a French law prohibiting abortion and the use of contraception in the Republic of South Vietnam, abortions could be performed only for narrowly interpreted indications. Between the late 1960s and the early 1970s, family planning clinics offered services only to women with at least five living children. Even when family planning clinics were later expanded to include women with one living child, a marriage or cohabitation certificate was required to obtain an abortion.

Abortion on request has been available in North Vietnam since at least 1971, and in the entire country since its unification in 1975. The Law on the Protection of Public Health (June 30, 1989) states that "women shall be entitled to have an abortion if they so desire." According to Decision No. 162 of the Council of Ministers in January 1989, the State will supply, free of charge, birth-control devices and public-health services, including induced abortion, to eligible persons that register to practice family planning. As mentioned earlier, it is typical of former Marxist states to primarily rely on abortion, together with the IUD, for population control. Henceforth, all possible grounds for abortion are permitted, as long as the abortion is performed by a physician.

The proportion of single women among all women seeking abortion has increased to 20 to 30% in 1995 (compared with 7% in 1991), suggesting an increase in premarital sexual activity. Attitudes toward informal dating have become more tolerant, especially in urban areas. The availability of Western videos, TV programs, and other media have brought specific images of sex and romance to young people, and these are slowly changing the norms of acceptable behavior in Vietnamese culture.

According to the United Nations, Vietnam had 59 abortions per 1,000 women in 1987, 71 per 1,000 in 1988, and 70 per 1,000 in 1989. The Alan Guttmacher Institute reported in 1998 that Vietnam had the highest abortion rate of any nation in 1996, with 83 abortions per 1,000 women between the ages of 15 and 44. This number covers only abortions performed at state clinics; and when private clinics are included, the abortion rate was 111 per 1,000 women, or a total of roughly two million abortions. In 1999, the state-run media reported that the abortion rate in Hanoi continues to rise. In the first six months of 1999, 33,215 abortions were performed at Hanoi city hospitals, a 3% increase over the previous year, and nearly double the number of reported births. Although the government does not espouse abortion as a preferred family planning method, the procedure is heavily subsidized by the government, and many published family-planning campaigns still list abortion as a method of birth control after IUDs, condoms, and the pill, according to the *Deutsche Presse-Agentur* (7/1999).

## 10. Sexually Transmitted Diseases and HIV/AIDS

### A. Sexually Transmitted Diseases

There is no information on venereal diseases in the early days of what is now Vietnam, although some descriptions of Sino-Annamese medicine suggest that this "scholarly" medicine did already know a distinction between the early and late symptoms of syphilis. Altogether, the frequencies of STDs were apparently only high in those regions that had a close contact with Europeans. Figures for the early French period are also difficult to obtain. The first French colonial physicians were largely concerned with malaria and dysen-

tery, since these were responsible for decimating the troops. However, as rates of morbidity for sexually transmitted diseases (STDs) in the colonial army increased to one in ten in 1887, the French colony of 1890 reached first place, along with Madagascar, in all reports on venereal diseases. The situation did not improve at the beginning of the 20th century. Between 1903 and 1911, morbidity attributed to syphilis increased among the French troops to account for 23 to 40 hospital admissions per 1,000 men. In a division stationed in Tonkin, the medical officer noted that in 1902, venereal diseases accounted for 8.4% of total morbidity (508 admissions), of which 1.1% were for syphilis, 3.7% for gonorrhea, and 3.5% for chancroid and its complications. In 1904, out of 607 admissions, the total percentage of venereal diseases went up to 19.1%, with percentages for each of the three conditions at 3.7%, 9.7%, and 5.7%, respectively. For the medical officer, the spectacular rise coincided with the 1901-1902 expedition to China, which had mobilized contingents from Tonkin (Guénel 1997).

According to Assistance Médicale d'Indochine, founded in 1904, STDs became the second most common reason for hospitalization after malaria in the 1910s. The first statistics regarding STDs in the Vietnamese population are available through the maternity hospital in Cholon: During the first quarter of 1927, out of 2,500 births, 40% of the children had congenital syphilis. Guénel (1997) suggests this accounted for a large part of the perinatal mortality of 38%. In the North, at Hanoi, one in four children was estimated to die of syphilis during the first year. But one has to keep in mind that even in 1930, not more than 10% of the population in the big cities was accessing the services of the Assistance Médicale, and hardly any of the rural population did. All over Indochina, 92% of the prostitutes were infected with STDs compared with 10% in France.

Although hospital admissions because of syphilis infections decreased slightly during the 1930s, from 61% in 1930 to 21% in 1938, gonorrhea increased from 49% in 1930 to 70% in 1938. The two Indochina wars reactivated the problem of infected servicemen: Between 1945 and 1954, 12% of the 1.6 million men (700,000 of whom were Indochinese) were suffering from one of the four STDs then diagnosed. In 1975, the South Vietnamese government estimated that 10% of the population, or one million people, were infected, compared with a paltry 350 STD-infected American soldiers in 1963 (Greenberg 1972). In North Vietnam, as well as later in the unified country, the existence of venereal diseases was denied.

According to the WHO (1993), in 1991, gonorrhea still accounted for the highest percentage among STDs with 11 cases per 100,000 inhabitants. The Ho Chi Minh City Dermato-Venereology Institute, reorganized in 1975, reported a certain stabilization of STDs since 1985, representing, on average, 10% of all consultations (13,700 in 1993 for STDs alone), with a still marked prevalence of syphilis and gonorrhea, 25% and 17%, respectively, of STDs in 1993, according to Guénel (1997). The National Institute situated in Hanoi assesses the prevalence of syphilis at 10,000 cases per annum. But as Guénel points out, the incidence of STDs in Vietnam elude national statistics, much more so than in industrialized countries.

## B. HIV/AIDS

Epidemiological and laboratory data indicate that epidemic spread of the HIV virus, the cause of AIDS, did not occur in any large human population until the mid- to late 1970s. During the early to mid-1980s, extensive spread was documented for sub-Saharan Africa, the industrialized Western countries of North America, Europe, and Oceania, and

many countries of Latin America, including the Caribbean. Although a few HIV infections and AIDS cases were detected in Asia during that period, there was no evidence of an epidemic spread, leading to speculation that AIDS would not become a major global health problem. Since the late 1980s, however, when explosive epidemics of HIV were documented in several South and Southeast Asian countries, the general complacency about AIDS has given way to alarm over the virus's potentially devastating impact on individual lives, as well as on the economies of the region.

In Vietnam, the first AIDS case was identified in 1990. It is safe to say that the epidemic will continue to spread, although the prevalence and distribution of AIDS, as well as the future of other STDs, such as syphilis and gonorrhea, will vary widely among Asian countries. Countries with low STD-prevalence rates should not expect to have high rates of HIV and AIDS, but countries and populations with high STD rates are at high risk of developing high HIV/AIDS rates in the future, the reason being that syphilis and other STDs are spread through the same routes as HIV.

A study conducted by Franklin on HIV/AIDS in late 1993 found that 54% of the men interviewed in cafés, restaurants, nightclubs, parks, and the streets where sex was sold or where dates for sex could be made, had had two or more sexual partners in the previous two weeks (as cited by Goodkind 1997). Within three years, from 1996 to 1999, the number of reported HIV cases doubled. By late 1999, approximately 15,800 Vietnamese were reported HIV-positive, and approximately 1,500 had died of AIDS. The actual number of infections, however, could be ten times that number. Most cases go undetected because HIV testing is only done selectively. The actual number of people infected with HIV by the end of 1999 was expected to exceed 129,000. Vietnam's biggest city, Ho Chi Minh City, claimed the highest number with 2,600 cases. The disease is expected to have an especially harmful effect, not only on individual lives, but also on the economy, because 50% of those infected are between 15 and 24 years old.

HIV cases among Vietnam's prison inmates have tripled since 1998, now comprising one fifth of all infections in the country, according to a government newspaper. A total of 22,161 inmates had tested HIV-positive as of July 20, 1999, with 3,621 AIDS cases and 1,895 inmate deaths from AIDS since the first case detection in 1990. A National AIDS Committee official said that the actual number of HIV infections in Vietnam's prisons could be 10 times higher. Infected inmates remain in the general prison population until they develop AIDS, when they are transferred to the prison's clinic. Hoping to curb the spread of the virus, the Ministry of Public Security launched an HIV/AIDS-awareness campaign in prisons and correctional institutions in 1999 (Associated Press 7/28/99).

The Vietnamese government has launched nationwide campaigns to raise people's awareness. Using mass media and other avenues, the campaigns are designed to provide Vietnamese students and 90% of people between ages 15 and 50 with general knowledge of the epidemic and how to protect themselves. However, cultural taboos have proven to be a hindrance to tackling the issue. An estimated 200,000 intravenous drug users and 100,000 prostitutes are blamed for the spread of AIDS.

[Update 2002: UNAIDS Epidemiological Assessment: After the first HIV case was reported in Vietnam in 1990, the number of reported HIV infections and AIDS cases grew rapidly in all provinces. The total of reported HIV infections had reached 43,410 by December 2001. An estimated 130,000 people were living with HIV/AIDS at the end of 2001.

[In 2000, HIV prevalence was highest among injecting drug users (24%). Although data on HIV/STD risk behavior are not included in routine HIV surveillance, behavioral surveys of injecting drug users indicate that 28% share equipment. Sexual transmission of HIV has increased among female sex workers; the prevalence rate increased from 0.6% in 1994 to 3.5% in 2000. In 2000, while the majority of reported HIV infections occurred among injecting drug users (63% of cumulative numbers), estimates of HIV/AIDS indicate that the majority of HIV infections are sexually transmitted (81%).

[Available data from point prevalence studies suggest that there is a major burden of STDs, and particularly syphilis, among sex workers. There is a lower, but still significant, STD prevalence among women, including pregnant women. Quinolone resistance is emerging (56.7% for first-generation Quinolone and 42.7% for second-generation Quinolone). Gonococcal resistance to penicillin is also important (47%).

[The estimated number of adults and children living with HIV/AIDS on January 1, 2002, were:

Adults ages 15-49:	130,000 (rate: 0.3%)
Women ages 15-49:	35,000
Children ages 0-15:	2,500

[An estimated 6,600 adults and children died of AIDS during 2001.

[At the end of 2001, an estimated 22,000 Vietnamese children under age 15 were living without one or both parents who had died of AIDS. (End of update by the Editors)]

#### [HIV/AIDS, 2001-2003

[Update 2003: In mid 2001, Vietnam's Ministry of Health AIDS Committee reported positive HIV test results for 37,111 people, but admitted the actual number of HIV carriers in the country might have exceeded 137,000. The committee estimated that the actual number of HIV-positive citizens could reach 197,000 by 2005, with increases of 12,000 to 18,000 per year over the next five years. The number of Vietnamese with AIDS increased by 24.1% in 2001, while AIDS-related deaths rose by 22%. To prevent an increase in cases, the Vietnamese government allocated \$4.2 million to buy HIV test kits, ensure safe blood transfusions, and raise public awareness. Ho Chi Minh City ranked first among the nation's 61 cities and provinces for HIV infection, with 7,690 cases reported. Illegal drug users accounted for 65% of the reported HIV-positive population, while nearly 25% of all IV-drug users in Vietnam in 2001 were HIV-positive. At the same time, 20% of the prostitutes tested HIV-positive, up eightfold since 1994. Between 1994 and 2001, HIV infection rose tenfold among pregnant women and tripled among tuberculosis patients.

[Dr. Laurent Zessler, a UNAIDS representative in Hanoi, said that the AIDS epidemic could easily become "extremely serious" in Vietnam, adding that he does not feel the Vietnamese government is "acknowledging the full magnitude of the problem." Zessler said that schools should offer more HIV-prevention education and the government should increase access to condoms, especially among sex workers. Condoms should be made available at bars, clubs, and brothels, he said, adding that condoms are currently only available in family planning and health clinics. "It's really a political and organizational issue. We have the condoms here. They are quite cheap. But the decision has not been made to make them more available" (Mozes, Reuters Health January 2, 2002).

[In mid February 2003, Vietnam Vice President Truong My Hoa announced that the country needs to "take a more active approach" in its HIV/AIDS treatment and prevention

efforts, according to *Vietnam News*. She said that the "current breathtaking spread" of the disease has "damaged" the health of many citizens and affected the country's socioeconomic growth. Truong called for the country's AIDS Standing Bureau and Health Ministry to offer "more effective" solutions to help establish a national AIDS-prevention strategy by 2010. According to a Ministry of Health report, the number of new HIV cases in Vietnam in 2002 was almost 16,000, up 28% from 2001 (Xinhua News Agency February 19, 2003). According to a February 18, 2003, report by *Agence France-Presse*, Vietnam Ministry of Health officials announced that the ministry would make Lamzidivir, a combination of the antiretroviral drugs lamivudine and zidovudine, available to local health centers at a low cost. HIV-positive pregnant women and healthcare workers will receive the drug free of charge, but the drug will be available to others for \$900 per year. The drugs will be produced by the Vietnamese drug maker, MST Trading. A spokesperson for the pharmaceutical company said it has been manufacturing Lamzidivir for an "unnamed" South Korean firm to export to South Africa. (End of update by J. Pastoetter)]

### 11. Sexual Dysfunctions, Counseling, and Therapies

As O'Harrow (1995) pointed out, Vietnamese men tend to think of lovemaking in almost medical terms, concerned about the maintenance of their potency, psychological as well as physical. The main "sex therapy" for impotence is Chinese medicine. On the side of women, giving birth only to daughters is still regarded as the only noteworthy female "sexual dysfunction." But she can rely on her confidante, the soothsayer, fortuneteller, or *thay boi*. The *thay boi* is nearly always herself female, and although men also come to learn the future from her, the majority of her clients are women, with whom she maintains a semi-psycho relationship. The ability to be of help depends on the *thay boi*'s combined knowledge of and sensitivity to the predictable psychological concerns of her women clients, the range going from faithless husbands to vicious mother-in-laws, prying sister-in-laws, and rebellious children. She controls the commonly accepted cultural signs and knows the symbols that are needed to interpret these phenomena in a manner acceptable to her clients. The fortuneteller is the only credible yet disinterested female confidante available to Vietnamese women suffering psychological pain.

### 12. Sex Research and Advanced Professional Education

#### A. The Nature of Vietnamese Sex Research and Resources

According to Fahey (1998), very little social science research of any sort—in the Western meaning of the word—has been conducted in the country after the reunification of Vietnam in 1976. The Communist Party's approach to social issues has been prescriptive rather than analytic. It was not until the mid-1980s that social research centers were established. Most contemporary Vietnamese research on women's issues is generated through these centers, including the Center for Research on Gender in Hanoi and the Center for Scientific Study of Women and the Family in Ho Chi Minh City. As Fahey (1998) further observes, the Women's Union and women's branches of organizations like the Vietnam General Confederation of Labor have a much longer history, with the responsibility of lobbying for women's rights and conflict resolution. Although they have generated some information on women's position, more recently they have been co-opted by international organiza-

tions for the administration of aid and have lost much of their lobbying role. At the same time, the Women's Union, a national organization of over 11 million members and 7,000 employees, has shifted from an organization responsible for protecting women's rights to an implementation agency for programs of immunization, family planning, credit, and nutrition education for international funding organizations.

Fahey (1998) points out that, for political reasons, the social science research by Vietnamese scholars largely plays down the importance of divisions other than those stemming from Confucianism or the cult of the ancestors cutting across the nature of the family-like class and regional differences. Research is concentrated rather on politically relevant issues, like female employment, access to birth control, and prostitution and other so-called "social evils," like drug addiction, alcoholism, and gambling. Concerns with no immediate policy relevance, such as the commodification of women, have hardly been considered as yet. But in 1996, a very interesting survey was conducted by the Hanoi Institute of Sociology in cooperation with the Population Council to gain understanding of the participants' views toward sexuality and sexual activity, including differences across the pre-*doi moi* and *doi moi*-era generation (Khuat Thu Hong 1998).

## B. Institutes for Sexological Research

There is no independent institute for sexological research in Vietnam. The main Vietnamese organizations involved in sexological research are strictly regulated by the government and its ministries. The more-recent research projects were conducted by the Research Center of Gender, Family and Environment in Development (CGFED) and by the Center for Women and Family Studies (CWFS). The Institute of Sociology and the Institute of Educational Psychology of Hanoi University are leading in surveys dealing with sexual-related topics. The Committee for Population and Family Planning (CPFP) and the Women's Union, as well as the Youth Union of Vietnam, both in Hanoi, have also conducted some sexological research. There is also the Vietnam Family Planning Association (VINAFPA). The Population Council Hanoi supports these institutions and single researchers, as well as conducts its own studies. The Population Council assists the Vietnamese government in testing reproductive-health interventions and incorporating them into current maternal and child health and family planning policies, programs, and research.

The reproductive-health-program objectives are to develop intervention research and training and to provide research results to individuals at all levels in the public and private sectors. The current agenda addresses a broad range of reproductive concerns, including youth reproductive health, male involvement, reproductive tract infections (RTIs), sexuality, violence, and sexual harassment. The Save the Children Fund (SCF) is very active in conducting studies about child prostitution.

### *[Sexual Attitudes and Behaviors among Ethnic Minorities*

[Update 2002: About 10% of the population of Vietnam belongs either to the Chinese, the Cham, or the Montagnards (hill tribes). Especially since the Reunification in 1976, but also in the 150 years since the colonization, first the French and then Vietnamese nationalists worked for the assimilation of these ethnic groups. These efforts, in combination with the devastating effects of the Vietnam War, led to a near extinction of cultural specifics. Many Chinese fled the country as boat people. In the process, the Cham lost most of their customs and were discouraged from using their ethnic lan-

guage. Eighty-five percent of the Montagnard villages were destroyed. Between 200,000 and 220,000 of the estimated one million Montagnards had died. The Vietnamese government resettled large numbers of Vietnamese in upland "economic zones," and the hill tribes were forced to move into newly erected cities. Meanwhile, one fourth of the central highlands had been deforested between 1975 and 1985. The Vietnamese Vice Minister of Culture summed up the direction of future policy when he proclaimed in 1976: "It is necessary to eradicate all the outmoded customs . . . while gradually bringing the new culture to each ethnic minority. The state has the duty to bring new, progressive culture to these people . . . in order to build a new culture with socialist objectives and Vietnamese national characteristics." As a result, nothing is known about the fate of the Cham and Montagnard minorities in recent years. There are some indications that they are disappearing.

[The following summary is based on the most recent reports, which were made several decades ago by Lebar, Hickey, and Musgrave (1964), the Cultural Information Analysis Center (1966), Mole (1970), and Hickey (1982ab). One has to keep in mind that the latter two were research projects done for the United States Army. The Army hoped to get a better understanding of these minorities in order to motivate and use them in the war against North Vietnam.

#### A. Cham

[The Chams remaining in Vietnam are descendants of the ancient kingdom of Champa. They are located mainly along the south central coast of Vietnam and speak a language of the Malayo-Polynesian stock. Around 1960, there were 45,000 in all of South Vietnam. The sexual behavior of the Cham was strongly influenced by Hinduism and later by Islam, but they have retained some beliefs and practices of both traditions. Parents permitted their daughters great freedom of choice in marriage. The girl's parents made the overtures in asking the boy in marriage. Among the non-Muslim Chams, there was no marriage ritual. When marriage was agreed upon, the boy went to live in the compound of the girl's family. A feast was held, and the boy presented the girl with gold or silver as a symbol of the marriage. Among the well-to-do, this gift may have been larger, including much silver, or several buffaloes. Muslim marriages, however, did entail a ritual. Imams acted as witnesses, and the parents had a role in the ritual. The girl's parents asked the groom if he accepted their daughter in marriage, and he was expected to respond positively. A large feast followed. The boy had to live in the girl's family. For those few who could afford it, polygyny was allowed, though seldom practiced. The consent of the first wife was necessary. Divorce was generally demanded by the woman, who got the house as well as two thirds of the common property.

#### B. Montagnards

[Around 60 different tribes dwelled in the wooded hills of the southern portion of the Annam Cordillera. Geographically, this area has come to be known as the Vietnamese Central Highlands. The French gave these tribes the collective name "Montagnards." They speak languages of the Mon-Khmer or Malayo-Polynesian linguistic stocks and physically resemble Cambodians, Malays, and Indonesians. Although divided into nearly 40 distinct ethnic groups, Montagnard characteristics have historically set them apart from the Cham and Vietnamese. According to Lebar, Hickey, and Musgrave (1964), the Montagnard tribes of North Vietnam were the Black Tai, Khua, Laqua, Lati, May, Muong, Nhang, Pa-y, Red Tai, Ruc, Sach, Tho, T'ou Lao, Trung-cha, and White Tai. In South Vietnam were found the

Bahnar, Bih, Bout, Bru, Cao, Chams, Chrau, Churu, Cua, Duane, Halang, Hre, Hroy, Jarai, Jeh, Kalo, Katu, Kayong, Kil, Krung, Lang Ya, Lat, Laya, Loven, Ma, Menam, Mnong, Monom, Noang, Noar, Nop, Pacoh, Phuong, Pru, Raglai, Rai, Rengao, Rhadé Rein, Saran, Seeding, Sop, Sre, Stieng, and Tring. These tribes had further subgroups.

[Men and women seem to have occupied positions of near equality in most Montagnard tribes, although only men could become elders. The health of the adults may be described as good, because they had survived in spite of a high infant-mortality rate, exposure to many endemic diseases, and malnutrition. Village sanitation and the tribesmen's personal hygiene practices were rudimentary. Some tribes, such as the Jeh, held the belief that cleanliness angers the spirits. Mite-borne typhus and venereal diseases were associated with poor sanitation and inadequate sexual hygiene. Malaria was very common.

[As Mole (1970) reported, the family structure varied greatly from tribe to tribe. In some tribes, parents chose marriage partners for their children based upon alliances or economic factors. Others allowed the male to choose his own bride(s) with the encouragement and economic support of the clan. A few tribes were so structured that the girl or her mother made the choice of a groom. The newly married couple might reside with the parents of the groom (patrilocal) in an extended-family longhouse or in a single-unit house in the groom's family village (neolocal). They might live in the same family village as the bride's family in a single-family house or with the bride's extended-family longhouse (matrilocal). In rare cases, the newly married couple established their home in a new community or in one unrelated to the parents of either groom or bride.

[Some tribes required dowries of the husband, others, dowries of the wife, whereas some had no required payments. Marriage arrangements usually required the services of an intermediary in order to save "face" and act as a buffer when marriage-price bargaining became serious. When the marriage ceremony occurred, it was surrounded with prescribed rituals that had to be followed for the villagers to consider the marriage properly begun.

[When children were born, their name was determined by whether the family was patrilineal or matrilineal. Customs pertaining to divorce were so varied that specific statements required reference to a particular tribe in order to have factual relevance. The same goes for the rules about what had to be done after the death of one's husband or wife. For example, among the Upland Cham Group of the Jarai, when a wife died, her unmarried sister had to marry the widower. If there were no unmarried sisters, the widower returned to his maternal longhouse, while his children remained at their mother's longhouse. With the Rhadé, if a husband died, one of his younger brothers was expected to take the widow as his wife. If the eligible brothers were already married, one of them might take the widow as a second wife, although this was not obligatory. It was taboo for a man to marry the widow of his younger brother.

[Reflecting a negative attitude towards the genitals is the widely practiced custom of shielding a newborn child from the influence of evil spirits by giving him or her names like "pig," "naughty," or the names of sex organs. Because male babies were more highly prized, yet had a higher death rate, they were often given girls' names and dressed in girls' clothing to fool the spirits.

[In most tribes, children of both sexes were brought up together until puberty began. Puberty rites included the filing of the teeth, because long teeth were regarded as animal, or as by most tribes, filed down and lacquered teeth were regarded as enhancing the male's and/or female's sex appeal. Premari-

tal sexual relations were mostly discouraged by fines and the knowledge that any village misfortune, such as the sudden death of some animal, was to be blamed upon the guilty lovers. The fine had to be paid to both the village and their parents, mainly as compensation for not consulting them. The couple was also required to marry. On the other hand, among the Jarai, unmarried young people who were not engaged might freely indulge in sexual relations as long as they did not have them with any member of their family.

[Marriage and adultery were regarded quite similarly by the different tribes. They greatly respected marriage, so harmonious relationships between husband and wife were prized. The traditional tribal laws regarding adultery reflected the binding nature of wedlock. However, adultery, a deviation from the marriage pattern, was a frequent cause of family discord. If a married woman committed adultery and had a child, the Bahnar considered her husband the father. If a married man had a child by an unmarried girl, he paid her a fine; if he asked the girl to become his wife of second rank and she refused, he owed her nothing. Theoretically, once the fine had been paid, the normal life of the family went on as before. In actuality, the Bahnar could be very jealous, and adultery could produce antagonism among the persons involved.

[The Hre regarded adultery even more seriously as a violation requiring village intervention to punish the guilty. The penalties for adultery were one buffalo or five copper pots; if one adulterer was unmarried, it was only one pig. Since brother-sister incest was believed not only to bring misfortune to the guilty party, but also disaster to the village, sacrifices imploring the pardon of the spirits were required, and the property of the parents of the guilty pair was confiscated and divided among their relatives. The offenders had to publicly apologize to the village, eat from a trough used by pigs, and were banished from the village.

[Roots and herbs for use as abortive preparations were known by all the tribes, though it depended upon the village policy if they were more or less in use. Generally, it was thought as acceptable to kill ill or deformed infants after the birth. (*End of update by J. Pastoetter*)

## Summary

Vietnam is a country with a long and complex history and cultural traditions that vary a good deal in the different regions. We hope this heterogeneous character is clear in our chapter. As in other Southeast Asian countries, Vietnamese society is in rapid transformation because of the enormous influx of "modern" thinking as presented by commercials, international women's and men's magazines, and the introduction of Western economic system rules. The Vietnamese people are trying to find, at least in privacy, some stability and security, especially for the traditional values of the national ethic system of Confucianism. From a sexological viewpoint, this is, literally, a deadly mixture. It involves a tension between sexual hedonism and the perception of sex as something to buy or sell on one side, and the customs and traditions demanding a strict separation between sexual pleasures and ordinary life on the other side. Talking about sexuality, be it in public or in intimate partnership, is a Vietnamese taboo. This makes for an ideal breeding ground for AIDS and other STDs. But it also means that a neutral and unprejudiced approach to sexual habits is hardly possible, not just for the people, but also for the state representatives and researchers. Foreign researchers, in particular, are not seen as neutral and nonjudgmental, but as outsiders. The perceived threat of the ethic (outside) researcher calls into play the most important rule of Confucianism, "save face."

Our chapter is a direct result of this cultural rule, and it is not accidental that most of the historic and culturally relevant materials we drew on reflect a strong subjective coloring. This material was gathered by foreigners, who reported (and often exaggerated) only what was interesting from their etic viewpoint, with little objectivity and considerable sensational flavoring to create French or American public interest in their books. Unfortunately, we have no other resources. Sex research in Vietnam is still, even today, only legitimate if it serves public health issues like STD and AIDS research, family planning and abortion-related issues, or elimination of the victimization of women and children. Even then, it is difficult to decide which survey results are accurate and which are only politically correct. Gammeltoft (1999) reports this problem most insistently, and our experience with Vietnamese students and Vietnamese research confirmed this. To all these difficulties, one has to add that Vietnam is a nation with many different regional traditions. Without substantial funding and government cooperation, sexological field research in Vietnam will not be possible. Sexological research in Vietnam still awaits the arrival of a Vietnamese "Kinsey," much as sexological research was not possible in China until Dalin Liu obtained government cooperation and support for a Kinsey-like nationwide survey of 20,000 Chinese men and women (see M. P. Lau's summary of Dalin Liu's research in the chapter on China in this volume).

A long ignored but promising approach to Vietnamese sexuality might be a survey of U.S. Vietnam War veterans. Unfortunately, the U.S. Army did not care enough about the Vietnamese people or their own soldiers to gather data on what was going on in thousands of brothels and in the provinces during the war. Insights and perspectives provided by Robert Taylor (1997) suggest that this kind of retrospective research would still be possible in the U.S.A., as well as in Vietnam. It would be extremely useful to have data regarding how the military and civil societies deal with sexuality under the circumstances of war.

Vietnam won the war against the United States 25 years ago, but now it seems the U.S.A. will win the cultural war. At least, such is the perception of many people in Vietnam and the United States. This is only partly true, and then mainly for the young people. As for effective countermeasures against the rising tide of AIDS and other STDs, and more so for a healthy and even joyful sexuality, neither traditional Vietnamese values nor American pop culture offers any solutions for these challenges. In fact, they may make effective solutions more difficult. What Vietnam needs is an extended understanding of its own sexual heritage, neutral scientific sex surveys, and a broad public embracing of sex education. With these, Vietnam should be able to win the war against sexual ignorance.

### Acknowledgments

The author wishes to acknowledge the staff and Library of the Archive of Sexology, Berlin, especially its Director, Prof. Dr. Erwin Haerberle, for assistance and use of its holdings, and the staff and Library of Indiana University, Bloomington, and of the Kinsey Institute for Research in Sex, Gender, and Reproduction for assistance and use of their libraries and collections. The author also thanks Professor Frank Proschan, an expert on Vietnamese culture at the Folklore Institute at Indiana University (Bloomington).

### 6. Homoerotic, Homosexual, and Bisexual Behaviors

*Gay Unions* SOPHIA KAMENETZKY

[Update 2003: July 26, 2003: Buenos Aires, the capital city of Argentina, is the first city in Latin America to recognize civil unions for same-sex individuals. The new law applies only to city employees, and provides only a few basic rights. Despite these limits, observers see the action as a major legal breakthrough to the nationwide recognition of civil unions of same-sex couples. Medical and social rights of a city employee are extended to the employee's partner. Employees can ask for a leave to take care of a sick partner. They can jointly apply for loans and have the right to continue receiving state pensions in case of a partner's death. However, the rights to inherit at a partner's death and to adopt children have not been recognized.]

The law was passed by the state legislature in December 2002, and in May, the city issued its normative regulations. Soon afterward, special public registries were opening where couples could inscribe their union, independently of their sex. This means that heterosexual partners who decide not to marry can register to benefit from the same limited rights given to homosexual couples. Partners, who have reached the age of majority, can register by presenting at least two witnesses to certify that the two have been living together in the city of Buenos Aires for at least one year, and that they are single or divorced. Civil unions terminate by either death or marriage of a partner. A partner can also annul the union by making a presentation to the Public Registry and certifying that he has given notice of his decision to the other party.

As expected, the Catholic and Evangelical Churches were enraged by the recognition of same-sex civil unions, noting that the New Testament says that homosexuality is "one of the most horrendous perversions." Despite the reli-

gious opposition, in mid-2003, Mexico, Brazil, and Chile appeared ready to join Argentina in ratification of similar laws recognizing same-sex civil unions.

## Australia

### 10. Sexually Transmitted Diseases and HIV/AIDS

*Lesbian Sexual Health Risks* RAYMOND J. NOONAN

[Update 2003: Research findings from Sydney, Australia, published in the journal *Sexually Transmitted Infections* indicate that lesbians are just as likely to get sexually transmitted diseases as their heterosexual counterparts, in contrast to previous assumptions that they are at low risk for these diseases. In addition, they are far more likely to be drug users and to have had sex with homosexual men, making them almost eight times more likely to be infected with hepatitis C. Based on a study of 2,800 women at the Sydney Sexual Health Centre, doctors found that bacterial vaginosis was more prevalent in "women who had sex with other women," while herpes and genital warts were common in both groups, with gonorrhea and chlamydia rates low and similar. BBC News (2000) quoted the researchers as saying, "a woman's sexual identity is not an accurate predictor of behaviour, with a high proportion of 'lesbian' women reporting sex with (often high risk) men." In fact, they reported that women who had sex with women were more than three times more likely to report having had sex with a homosexual or bisexual man, with almost one in ten of these women having had more than 50 male sex partners.]

While it remains true that women who have sex with *only* women are at low risk for STDs, this research suggests that medical personnel should adopt the same approach often used in taking sex histories from men who have sex with men, i.e., eschewing labels and asking self-identified lesbian women whether they also have sex with men, in order to get a more-accurate assessment of risk.

BBC News (2003) also reported on a recent study from the United States that lesbians have a higher risk of heart disease and are generally more overweight than other women, further suggesting that health education messages targeted specifically to lesbian women need to be developed. The report noted that lesbians are more likely to be unconcerned about their weight, perhaps, quoting researchers, because "weight control is often perceived as a conventionally feminine behaviour," which might necessitate "a strategy that de-emphasises traditional feminine values."

### 6. Homoerotic, Homosexual, and Bisexual Behaviors

*Gay Marriage Legislation* MICHAEL BARRETT

[Update 2003: In June 2003, the Ontario Province Court of Appeals ruled in favor of a same-sex couples' right to marry. The judgment was not conditional and the judge gave approval to issue marriage licenses to same-sex couples in Ontario with the release of the decision. At the national level, the federal government said that it would not appeal the ruling—the federal government mandates marriage laws while the provinces enact them. This means that

legislation will now be brought forward to recognize same-sex marriage. The intent appears to be to do so in a way that will not compromise the rights of religious groups who choose not to marry same-sex couples on religious grounds. Nine provinces said at the time that they would support legislation that recognized same-sex unions. Alberta said that it would use the “notwithstanding” clause of the Constitution to block the legislation.

Earlier, in May of 2003, the British Columbia Court of Appeals had amended common law in a way that recognized same-sex unions, i.e., marriage was defined as the union of “two persons to the exclusion of all others.” Implementation of the decision had been suspended until July 2004, but the subsequent ruling in Ontario led the B.C. Court of Appeals to lift that suspension in July 2003 on the basis that the provinces would otherwise be unequal in their handling of the issue.

In the wake of these provincial court decisions, the federal government is now faced with determining how the Canadian Constitution can be interpreted in terms of the rights of religious institutions to refuse to marry same-sex couples and in terms of federal and provincial responsibilities with respect to marriage (Krauss 2003abc).

## 8. Significant Unconventional Sexual Behaviors

### *Sexual Abuse and the Churches* JULIE FRASER

[Update 2003: March 2003: Sexual abuse in Canada has also received attention in the past decade when accusations of abuse, alleged and proven, have increasingly been leveled at religious institutions and at members of those institutions. Catholic, Anglican, and United Churches, to name a few, have been associated with sexual abuse scandals, the financial and legal ramifications of which have threatened their livelihood and brought them into legal arguments with the Canadian Government.

A great many of these lawsuits pertain to abuse that happened at church-run schools. In many cases, although not all, these were schools for Native Canadian children. According to Sebok (2002), the Canadian Government took over the education of Native Canadian children in 1883 and relied heavily on Catholic, Methodist, Anglican, and Presbyterian churches. The Canadian experience with boarding schools for native children came to an end in mid-1980 and is now considered a political and cultural tragedy. It was not until the late 1990s that the victims began to sue individually for sexual abuse suffered while attending these schools.

The number of cases is too numerous to report; however, some of the more important legal issues will be highlighted. One legal focus has been the relative responsibility of the Government versus the churches. For example, in *FSM v. Clarke*, 11 W.W.R. 301 (B.S.S.C. 1999), a pupil at a residential school between 1969 and 1976 alleged that a dormitory supervisor sexually assaulted him and other pupils. He sued the Anglican Church and the Government of Canada. In this case, the court found the Anglican Church 60% responsible, and the Canadian government 40% responsible (Sebok 2002). Subsequent to this, other cases followed pertaining to incidences of sexual abuse happening as much as 50 years prior. In *M. M. v. Roman Catholic Church of Canada*, 180 D.L.R. (4<sup>th</sup>) 737 (Man. Q.B. 1999), for example, a 70-year-old woman who had attended a school between

1930 and 1942 alleged not only sexual abuse, but also that the Church “strove to deprive the plaintiff of her culture and way of life.”

While the survivors of the abuse deal with the psychological trauma, the churches deal with the negative publicity, as well as the potentially crippling financial burden associated with litigation. As of 2002, there were approximately 9,000 outstanding residential school lawsuits. The Anglican Church estimates that the combined liability for the government and the churches might reach \$1 billion (Canadian). One western Anglican diocese has ceased to operate under the weight of individual lawsuits.

## India

### 5. Interpersonal Heterosexual Behaviors

#### *“Assisted” Arranged Marriages*

ROBERT T. FRANCOEUR

[Update 2003: Although traditional arranged marriages are still the norm in India, the practice is evolving in response to the spread of romantic love among the middle class in the larger cities of India. A second stimulus for change is occurring within the clannish, tight-knit Indian expatriate communities in Britain, as second- and third-generation children adapt the nature of the arrangement to life in the U.K. (Francoeur 1982, 66; Alvarez 2003).

In traditional Indian arranged marriages, selecting the best spouse for a son or daughter has been the exclusive responsibility of parents and grandparents, and particularly the “Aunt Bijis,” as Muslims call their matchmakers. Parents and Aunt Bijis rely on recommendations from other family members and friends, and on “matrimonials” placed in the appropriate Indian newspaper, in India, the U.K., the U.S.A., or any other place with a large immigrant Indian population.

Typical matrimonials, like the two below, describe the age, physical appearance, education, and caste of the son or daughter:

Parents invite correspondence from a tall, handsome, professional, or educated businessman for their 27-year-old, 5' 5", very handsome, fair complexion, homely [domestic-skilled] daughter with green card and M.B.B.S from a prestigious institution in India.

Physician father Brahmin invites correspondence from presentable, charming, and homely Gujarati girls for his U.S. citizen son, 29, 5' 8", 145, vegetarian, M.S. (computer eng). Send biodata with recent photographs (returnable). (Francoeur 1991, 37)

Twenty years ago, in Bombay, India's most cosmopolitan city, the revolutionary idea of romantic love that swept the U.S. a hundred years earlier was adopted by some middle-class youths from what they saw at the cinema. But in Bombay, as well as elsewhere in India, it is not easy for young people to meet without the supervision of some family member. A young woman talking with a man in the museum coffee shop or dancing in one of the discotheques runs the risk of ruining her reputation and chances for a decent marriage. An Indian woman at an American college will be very careful not to compromise her prospects back home by letting her parents know she has dated a foreigner. In 1990, only 5% of college students in India met without the introduction being arranged by their parents.

Modifications in the traditional arranged marriage began to appear as early as the 1960s, when a couple brought together by their parents would have an initial meeting before their extended families and then met alone several times, either with family members in another room or at a restaurant,

before delivering a verdict. In the 21st century, couples meet in public venues without the family encounter first.

But the problem has been how to make that first connection. In Bombay and other large cities in the 1980s, the owners of large halls solved this problem by sponsoring a Saturday evening for young people. Young women are admitted free while the young men pay a small admission fee for the privilege of going on stage to describe themselves and the kind of woman they are looking for in more detail than a “matrimonial” permits. After presenting himself, the young man wanders through the hall, hoping some young woman will slip him her name and address or phone number, so they can explore their mutual interests. If they connect, then the parents can be brought into the picture to take over the formal arrangements (Francoeur 1982, 66).

In the 21st century, young Indian natives and expatriates are pushing the cultural boundaries.

There is a boom in Asian marriage websites, chat rooms, Internet personal advertisements and even South Asian versions of speed dating, the latest phenomenon to hit the Indian community in London, with men and women meeting each other for just three minutes at restaurants and bars before moving on to the next potential mate.

One young professional Indian woman in London turned to Asian speed dating—with her mother’s blessing—after 10 unsuccessful introductions. She described these formal introductions as awkward, drawn-out affairs in which the young man, his mother, and several other relatives came over to meet her family. She wore her best Indian outfit, a sari or elegant Indian pants and top, and sat quietly, despite her normal chattiness. When called upon, she poured tea, and then talked briefly to her potential mate in a side room.

In an “assisted arranged marriage,” the abiding principles behind an arranged marriage still remain strong on the assumption that lust and romantic love do not make a lasting marriage, and when it comes to weigh similar backgrounds and compatibility, family knows best. But parents and elders, eager to avoid alienating their children, making them miserable, or seeing them go unmarried, have shown considerable flexibility. The arrangement is becoming more fluid, a bit more open, a nice compromise (Alvarez 2003).

## Indonesia

### 7. Gender Diversity and Transgender Issues

*New Roles for Transvestites* ROBERT T. FRANCOEUR  
 [Update 2003: Public records of transvestites taking prominent roles in Indonesian culture date from a 14th-century ruler, Hayam Wuruk, who is described in court annals as dressing as a woman in front of his ministers and using a woman’s name. Later, after the arrival of Islam, men often played the role of women in the village dance dramas of East Java, and they still do. The first president of independent Indonesia, Sukarno, writes proudly in his memoirs of playing female roles when he was a young man, putting powder on his face and rouge on his lips, and stuffing “two sweet breads” in his blouse. “With this addition to my shapely figure, everybody said I looked absolutely beautiful,” he reported. “After the show I pulled the breads out of my blouse and ate them.”

Under the autocratic rule of Sukarno’s successor, General Suharto, transvestites have won some rights. Known as *waria*—a combination of *wanita* (woman) and *pria* (man), transvestites are still sometimes rounded up and detained by the police if they are suspected of working as prostitutes. However, this varies, because in some cities they court business openly in what amounts to a late-night transvestite parade down the main thoroughfares looking for clients. In major cities, particularly on the Java, local governments provide training programs for transvestites who want to run beauty salons, become hairstylists, or run a wedding business providing brides with gowns, décor, and makeup, all in one package.

In the larger cities, the government hires older *waria* to help young *waria* learn a trade so they can become independent and not need to earn a living in prostitution. On Indonesian television, transvestites are regular hosts on comedy shows and appear as characters in a popular puppet show. In 1977, when sex-change operations were still relatively unusual in the West, government television showed a movie called *I Am Vivian*. Based on a true story, it showed how an Indonesian boy who felt more like a girl was finally accepted by his family as a transvestite. In one of the more striking scenes, a doctor advises Vivian to have a sex-change operation. The movie ends with her in a white wedding gown, complete with veil, being carried by the groom to the bridal suite. In modern Indonesia, sex-change operations are out of vogue. Some transvestites dress as a modest Muslim woman with a *jilbab*, the traditional head covering, but change to male garb when they go to the mosque to pray.

But Merlyn Sopjan, a 30-year old *waria* interviewed by Jane Perlez (2003) for a *New York Times* International report, is typical of the “new” Indonesian *waria*:

For two years, Merlyn Sopjan lived with her boyfriend. Using his name, she became Mrs. Nanang. She was known in the neighborhood as his wife, and tucked his photo into her wallet. She was admired for her feminine looks: with liquid eyes and pancake makeup, she has the allure of a model. . . . The women on the block knew, she said, that under her demure clothes and despite her “wiggling” walk, she was physically a man. “I lived in his house and I was part of the community,” she said, showing off a snapshot of herself with Mr. Nanang as they posed as a couple in casual clothes, her arm on his shoulder.

Now Merlyn and others like her are trying to create roles for themselves beyond their long tolerated positions as television stars, entertainers and beauticians, moving even into the political arena. Last month Merlyn tried to register as a candidate for mayor in Malang, the town in East Java near here where she is now finishing her civil engineering thesis at the university. Her application was denied by city officials on the ground that she missed the filing deadline by five minutes. It was not an explicit rejection on the basis of gender, though Merlyn suspects that had something to do with it. The rejection received sympathetic press coverage, with reporters asking why a “*waria*” should not have the same rights as anyone else. “I want *waria* to have a role in government,” Merlyn said. “That’s my mission.”

(See the comments on *hijra* and their recent attempts to run for government office in India in Section 7, Gender Diversity and Transgender Issues, in the chapter on India.)

## Japan

### 5. Interpersonal Heterosexual Behaviors

#### New Dating Behavior

ROBERT T. FRANCOEUR

[Update 2003: In the decades between the end of World War II and 1990, Japan moved from defeat to become a major industrialized nation. Social historians have only begun to identify, examine, and analyze the various political, economic, and cultural interactions that opened the Japanese people to outside influences in those years. During the years of prosperity, new generations of Japanese boys and girls grew up in a world of high expectations they would make it through the competition of higher education, find a reliable, lifelong job, marry a suitable partner in a marriage arranged by their parents, and begin their own family. In this world, the traditional rituals of courtship were still functional and supportive of the transition from child to young adult.

Prosperity allowed many of Japan's youth to vacation abroad during school breaks where they encountered Canadian, American, Australian, and other Western youth with very different courtship patterns. Although this undoubtedly meant some changes in gender roles, courtship, dating, and family, before the "economic bubble" collapsed in the 1990s, most university and high school graduates got jobs in a highly structured world that set their path through courtship and dating to marriage. In the 1990s, jobs for youth dried up and what remained were temporary jobs on the fringes of a depressed economy. In the process, with more free time and decreasing parental supervision, the younger generation began forming their own social groups, which, like their jobs, became part-time, low-stress, and temporary. Traditional expectations of financial security, independence, and marriage remain, but they are on hold. In the process, dating behavior has changed significantly.

Or so two surveys suggest (Webb 2002).

The first study, conducted by social scientists at the University of California, San Francisco, and Hiroshima University Medical School, surveyed 602 teens, ages 15 to 19, in the Shibuya section of Tokyo. A similar survey involved 16-year-olds in two rural prefectures. These surveys suggest that the traditional family-chaperoned courtship has given way to youth-controlled, part-time, low-stress, no-commitment, temporary relationships. "To many young Japanese people, everything about sex is casual," Masako Ono-Kihara, a public-health expert at Hiroshima University School of Medicine, observed. "Girls now share their boyfriends like they'd share chips. Everyone's hand is in the bag."

In a pattern reminiscent of American sexual relations after the advent of the contraceptive pill and before AIDS, 43% of the boys and girls in the Tokyo survey said they keep five or more *sekusutomo* or "sex friends" at a time. In the rural survey, 20% of boys and 18% of girls said they have at least five "sex friends" in a "circle of friends" who keep in touch by mobile phone. It is not unusual, according to the survey findings, to be a member of several social circles of friends, and to engage in sex with two or more in each circle. (See the update on "buddy sex" in Section 5B, Interpersonal Heterosexual Behaviors, Adolescent Sexual-ity, in the United States chapter).

Although the young Japanese assume their *sekusutomo* relations are very low risk because Japan has a very low rate of HIV infection and they are not having sex with prostitutes or foreigners, new studies show a significant rise in the incidence of STD infections among young Japanese. According to the Ministry of Health, STDs rose by 21% among Japa-

nese men under 24, and by 14% for women in same age group between 1998 and 2000 (the latest figures available). Condoms are seldom used by "sex friends"—condom sales have dropped 25% in the past decade. The abortion rate nearly doubled between 1999 and 2002 to 13 per 1,000. But that hardly compares with the American rate of 51 per 1,000.

To cope with these new health issues, the Ministry of Education has outlined a broad sex-education curriculum for high schools. However, since the program is optional and many school administrators are afraid of offending parents when answering questions about why this new program is needed, efforts to deal with the new dating patterns so far have not been effective.

### 1. Basic Sexological Premises

#### Gender Inequality in the Workplace

ROBERT T. FRANCOEUR

[Update 2003: Japan has been struggling since 1990 to pull itself out of a very painful and persistent economic slump that has had a negative impact on society in many ways, including courtship and premarital sex (see entry on New Dating Behavior, above). Many experts have concluded that expanding the role and status of women in the professional workforce could provide a far bigger stimulus to recovery than any scheme tried so far, including huge public-works projects to bailouts of failing companies.

In 2003, the World Economic Forum ranked Japan 69th among the 75 member nations in empowering its women. While 40% of Japanese women work outside the home, they hold only about 9% of managerial positions, compared with about 45% in the United States (see Table 1). At the same time, women's wages are about 65% of those of their male counterparts, one of the largest gaps in the industrial world. According to many labor economists, Japan is effectively fighting with one hand tied behind its back when it shunts women off the corporate ladder. "Japan has gone as far as it can go with a social model that consists of men filling all of the economic, management and political roles," Eiko Shinotsuka, the first woman to serve on the board of the Bank of Japan, told *The New York Times*, "We've never had such a long economic crisis as this one, though, and people are beginning to recognize that the place of women in our society is an important factor."

Japanese corporations follow a strict protocol that hires men almost exclusively for career positions open to ad-

Table 1

A Comparison of Japanese, European, and American Professional Women

	All Workers	Managerial Workers	Civil Service Workers		National Parliament & Congress
			General	Managerial	
Japan	41.0%	8.9%	20.2%	1.4%	7.3%
U.S.A.	46.6	46.0	49.3	23.1	14.3
Sweden	48.0	30.5	43.0	51.0	45.3
Britain	44.9	30.0	49.1	17.2	17.9
Germany	44.0	26.9	39.0	9.5	32.2

Source: Cabinet Office of Japan; International Labor Organization; Inter-Parliamentary Union.

vancement, while short-term work, clerical jobs, and serving tea are reserved for the "Office Ladies," O.L.s. In July of 2003, the Ministry of Economy pointed out that the profit margin in companies where women make up 40% to 50% of the staff were double the profit margin of companies where women account for 10% or less.

There is growing concern in some circles about the persistent failure of employers to provide flex time for working mothers, daycare centers, and pregnancy leaves, and provide women employees with the opportunity to advance their professional careers. Japan has practically no facilities for nursery schools and daycare. The Ministry of Education, for example, provides one public nursery school with a capacity of 20 children for the 38,000 government employees who work in Kasumigaseki, central Tokyo's administrative district. One good point is that this nursery school stays open until 10 p.m. Along with the persistent economic slump, experts are worried by the projections of a population decline that could produce huge labor shortages in the next half-century and possibly even economic collapse.

Still, the government resists putting any pressure of corporations to expand women's place in the economy. A government advisory panel has recommended that the public and private sectors aim to have at least 30% of managerial positions filled by women by 2020. There is even talk of the government adopting an affirmative action policy. At the same time, supporters of women's rights have been told by a former Prime Minister that the main reason for Japan's falling birthrate is the over-education of its women. Meanwhile, a top aide for the Prime Minister was recently quoted as saying that often women who are raped deserve it, while a legislator from the governing party said, approvingly, that the men who carried out such acts are virile and "good specimens."

Summing up the problem, one successful woman manager told *The New York Times*, "Men are really intimidated by professional women in Japan. But this is still a society where even when it looks like a woman has some authority, the men usually manage to stay on top."

## Morocco

### 1. Basic Sexological Premises

*Character of Gender Roles* ROBERT T. FRANCOEUR

[Update 2003: In the gender-segregated culture of Morocco and the Magribi (North African), reproduction is still a very important aspect of sex, more important than eroticism. In the Magribi value system, women's main social capital is their bodies. A woman's virginity is all-important—a deflowered woman is a used, secondhand object. This apartheid, the social segregation of males and females by the veil, by exclusion from public life, and seclusion in the *harim*, according to De Martino (1992, 25, 28), makes woman

a mysterious, almost unattainable, often idealized object. Simultaneously she is desired and feared precisely because she is unknown. Even where the separation is less rigorous (at work, on the beach) rarely is heterosexual "love made." If at all, petting, masturbation, and sodomy are practiced. The vagina is excluded as a holy, forbidden part of the female body. Woman is the prime target of the desire (and fantasies) of the Moroccan. The diverting to the ass, just to release tensions, is something different from "homosexuality" as understood in the West. . . . The

cardinal point of Islamic sexuality is not the general practice of sodomy, but the despising of women (De Martino 1992, 28).

On the other side, today everywhere in Morocco, personal prestige and power are revered. Men seem to be entrapped by an excessive adoration of virility, identification with the father, hero worship, a cult of force and domination, contempt of everything weak, and disdain and fear of women (De Martino 1992, 25).

### 3. Knowledge and Education about Sexuality

*Sexuality Education* ROBERT T. FRANCOEUR

[Update 2003: In the home, any mention of sexuality or intimate matters is taboo, *haram*, holy, forbidden, protected. It would embarrass both parties. Because parents would not discuss sexual matters with a son or daughter, they are left to get their sex education from their peers. Sexuality then is seen as something not belonging to the family, something "outside," and therefore suspect, shameful, and bad (Eppink 1992, 33).

### 4. Autoerotic Behaviors and Patterns

*Masturbation* ROBERT T. FRANCOEUR

[Update 2003: According to Eppink,

Masturbation as a possibility for sexual fulfillment is strongly repudiated and least valued, because it lacks an object [to be penetrated]. This has to do with the value attached to intromission and ejaculation.

In the Western middle-class frame of reference, sexuality is highly related to eroticism and love. This is by no means the case in all cultures and in all times. Vanggaard describes types of aggressive sexuality in cultures of pre-Christian Europe: The sexual act of the active man is intended to make the object passive, to submit him [*sic*]. This seems to be true for North Africa as well. Masturbating—not submitting some other person—is not manly; therefore "*kaffat*/masturbator" is a term of abuse.

Nevertheless (fitting the pattern of group security) boys often masturbate together, outside or in a room, or at the movies where it is quite common. This is done touching each other, but it is not normal to look at each other's penis and to talk about it.

Masturbation is one of the most delicate topics to talk about. Often it is claimed that it is not necessary, "because there are so many other possibilities." (Eppink 1992, 35)

### 5. Interpersonal Heterosexual Behaviors

*Adolescent Sexual Behavior* ROBERT T. FRANCOEUR

[Update 2003: Boys under age 9 develop a protective all-male peer group with whom they hang out. They walk hand-in-hand, share jokes, complement each other on their manly looks, and exchange "friendship letters," which some view as a kind of homoerotic same-sex love letters. Between ages 9 and 17, a boy becomes a *zamel*, the recipient of anal sex with cousins, teachers, and neighbors, either out of necessity because he is forced into it, by intimidation, by seduction, or by the offer of presents or money. At age 15 or 16, a *zamel* loses his admirers or he starts refusing their advances. He becomes a "man," meaning that now he becomes the active partner in anal sex with younger boys and actively courts girls. Youths, who continue as recipients of anal intercourse, are ridiculed as *hassas*. Some *hassases* become "swishing faggots," "drag queens" who create their own little subculture, appearing as women:

an image of an image, the imitation of the image the *Magribi* has of a woman, distant, separated, idealized, and despised all at the same time. Finally, in their mature

years, there is the great mass of men who like to fuck—girls, *hassases*, married women, boys, tourists, and prostitutes alike. (De Martino 1992)

As they mature sexually, Moroccan boys can masturbate, accept passive anal contact with another male, or try to have active anal contact with another male, a female, or an animal, or have heterosexual vaginal intercourse. In these options, the highest value is attached to the last possibility and the lowest to the first possibility. But regardless of the sexual expression, the emphasis in sexual contacts is not on friendship or romantic love, but on penetration and ejaculation. Penetration is a manifestation of male power, so sex is essentially penetration and quick ejaculation. This does not mean that affection is never felt; but romantic love does not predominate in a sexual relationship, nor in marriage. Kissing and oral-genital contact are not customary. Foreplay and petting—like masturbation—are viewed as inferior, and such behavior is often labeled as “weak” or “strange” (De Martino 1992, 28); Eppink 1992, 36-37).

## Nepal

### 5. Interpersonal Heterosexual Behaviors

*New Courtship Rituals* ROBERT T. FRANCOEUR  
 [Update 2003: Until recently, young Nepalese in a small village 100 miles (160 km) southwest of Katmandu were guided as they entered the adult world by centuries-old social customs and traditions. But that world has been changing, according to anthropologist Laura M. Ahearn, who has spent 15 years in a village she calls Junigau. It is still three-hours walk from Junigau to Tansen, the district center, but electricity reached into Junigau in 1996 and that means television and CD players will soon arrive. The traditional ways of Junigau, like those of every other rural village today, are vulnerable to the influences of the world outside.

In recent years, every aspect of Junigau's social fabric has been changed, even the deepest-rooted customs, from kinships and their role in every aspect of village life to the basic definitions of love, courtship, and marriage. Modern music and the popular Hindi romance films shown at the Tansen theater send a message about the importance of education, literacy, and modern lifestyles and values. Many young Junigau women attend college in Tansen. For young men, a career as a Gurkha soldier with the British or Indian armies is much more attractive than the hard labor of a subsistence farmer, the traditional economic base of Junigau. As a Gurkha soldier, a young man trades long tours of duty away from home for financial independence from his elders.

For centuries, Nepalese have viewed marriage as a joining of two families, with the selection of who married whom decided by the elders largely on the basis of complicated kinship and caste relationships. Marriages between certain types of cousins, for example, are highly desirable, while marriage to “the wrong type of cousin,” is definitely taboo and frowned upon. Becoming espoused to someone from a caste below the Magars, who make up bulk of Junigau's residents, is out of the question.

In traditional Junigau arranged marriages, husband and wife sometimes speak for the first time on their wedding

day. It is not uncommon, in Ahearn's observations, for a bride to wail plaintively throughout the marriage ceremony, and for the stunned groom to perform his part of the rituals, including the symbolic ritual deflowering, with grim resignation.

After the marriage, the bride moves in with her husband's family and her status as the newest daughter-in-law in the kinship hits rock bottom. The heaviest labor, the hardest chores are her lot, along with the custom of washing her husband's feet every morning and then drinking the wash water. (Some women, influenced by the world outside the valley, no longer wash their husband's feet.)

Between 1963 and 1983, 73% of all first marriages in Junigau were arranged, with elopements accounting for only 15%. Ten years later, in 1993, 35% of all first marriages were elopements and arranged marriages dropped to 54%. Since 1993, 9 out of 10 marriages have been elopements. According to Ahearn, elopements are showing a similar increase in other Nepalese villages.

Since dating is still taboo and meetings between young men and women are frowned on, the young people manage their selection and courtship with florid, exuberant, extremely romantic love letters. But before the couple makes any contact, both are likely to check one another out, with furtive inquiries among acquaintances, or tentative feeler letters.

Nepal being a very patriarchal culture, it is the young man who begins the correspondence. But first he must recruit a responsible messenger—often a younger sibling or young relative who is sworn to secrecy, to deliver his declarations of undying love to the woman he has chosen.

The love letters, in English or Hindi, often refer to well-known figures, designed to impress the recipient. “Love is the sort of thing that anyone can feel—even a great man of the world like Hitler loved Eva, they say.” Or, “And Napoleon, who with bravery conquered the ‘world,’ united it, and took it forward, was astounded when he saw one particular widow.” These letters employ a very Nepalese, non-Western notion of romance and love. As Ahearn explains, in the Nepalese culture, love is very serious from the start and inextricably entwined with economic development, progress, and appearing educated and modern. Love equals “life success.”

For a young woman, the path of romance is considerably more tricky than for her suitor. Answering a suitor's letter all but commits her to marrying him, even though she may only slightly know him or doesn't know him at all. If the courtship letters become public knowledge and she does not marry her correspondent, she will be disgraced, her courtship life over.

Both men and women put great effort into the crafting of these letters. “It's a distinctive genre,” said Ahearn, “very different from spoken Nepali and from written Nepali.” How-to books are available in Tansen and Katmandu, but more often, the correspondents share tips on what to say and not say with friends.

If the correspondence goes well, a wedding plan is agreed upon. The couple elopes, and when they return, a Brahman priest performs a brief ceremony at the house of the groom's family if his parents agree. If the marriage goes against caste or kinship taboos, the bride's parents may refuse to accept the couple. More often, the bride's parents come to accept the union, inviting her back to their house for a feast, and allowing her to “visit when she wishes.”

Few older villagers are happy with their children choosing a spouse out of love. Like Tevye in *The Fiddler on the Roof* bemoaning his daughter's choice of a young revolutionary she loves over the wealthy butcher in his 60s that

Tevye chose for her, many Junigau parents yearn for the old days when they had more control of their children. The freedom to choose one's own mate upsets the centuries-old stable hierarchies that once determined who repaired the roof and who comes to family celebrations. Change who controls the choice of mate, change how males and females relate, and everything in the society is affected.

#### Update on Sexual Rights and Sharia

##### Death Penalties

ROBERT T. FRANCOEUR

[Update 2003: Addendum to Section 8D, Female Genital Mutilation and Other Harmful Practices: On August 27, 2003, an Associated Press release described the tearful appearance of 32-year-old Amina Lawal in a northern Nigerian Islamic appeals court to plead for her life. Divorced in 1999, Ms. Lawal was convicted in March 2002 of having sex outside marriage, two years after her divorce. The *Sharia* judges ordered that Ms. Lawal be buried up to her neck in sand and stoned. However, execution was delayed during her appeals and to allow her daughter, to be weaned. One of Ms. Lawal's lawyer contended that, under some interpretations of *Sharia*, babies can remain in gestation in their mother's womb for up to five years, making it possible under Islam that her former husband could have fathered the child. The judges said they would announce their ruling on her appeal September 25, 2003.

## Norway

### 1. Basic Sexological Premises

#### Gender Equality Affirmative Action

ROBERT T. FRANCOEUR

[Update 2003: In mid 2003, despite strong vocal opposition from the nation's business community and organizations, Norway's Parliament is expected to pass legislation soon that will force an estimated 600 of the nation's largest businesses to increase the number of women on their corporate boards from the current 8.4% to 40% by July 2005, with penalties applied in 2007. Most corporate boards average six members who are among the nation's recently wealthy, and frequently hold a seat on a dozen or more corporate boards. Norway passed an Equal Status Act in 1979 requiring that 40% of the boards of local and state governments be women. In 1981, Norway had its first woman prime minister. By 1986, women held 44% of the Cabinet posts, a presence that has remained steady for 17 years.

Sweden is preparing to follow Norway's example with the threat of legal action if the boards of publicly listed companies do not increase the number of women on their boards from the present 8% to 25% by 2004. By contrast, in 2001, women held 12.4% of all board seats in Fortune 1,000 companies.

## Philippines

### 10. Sexually Transmitted Diseases and HIV/AIDS

#### An HIV/AIDS Paradox

ROBERT T. FRANCOEUR

[Update 2003: Prevailing public-health wisdom says that very low condom use should result in a high incidence of HIV infections and AIDS. In a paradox no one has yet explained, the Philippines has both a very low rate of condom use and, simultaneously, a very low rate of HIV infection. On the other hand, worldwide, encouraging regular condom use is an important element in HIV/AIDS-prevention efforts.

The reality is that, in 2003, only about 10,000 Filipinos were believed to be HIV-positive in a total population of 84.5 million. No one suggests underreporting as an explanation for this paradox.

Factors that one would expect to produce high rates of HIV and AIDS:

- More than half all Filipinos are of reproductive age and sexually active.
- The culture places a strong emphasis on large families.
- Only 23% of sexually active young men say they have ever used a condom.
- Only 4% say they use condoms regularly.
- Very porous borders allow uncontrolled immigration.
- A very conservative and politically powerful Catholic Church makes recommending or even mentioning condoms highly ill-advised.
- Only two out of five sex workers say they use condoms regularly. Most cannot afford condoms, or the antiviral drugs when they are infected.
- Eight-and-a-half million Filipinos who work overseas are potential carriers of disease whenever they visit home.
- The government has no AIDS-awareness program.
- The government restricts the campaigns of independent family-planning groups and NGOs, limiting their promotion of condom use.

The factors might offset the above high-risk factors, but experts are skeptical that the risk-reducing factors below, alone or in combination, might explain the low rate of HIV and AIDS. Which leads many experts to suggest that the low rate of HIV/AIDS is just a lucky-chance combination of the factors below, and that a real epidemic explosion might occur any time.

- A low ratio of customers to sex workers. The average Filipina commercial sex worker averages about four customers per week, significantly fewer clients than their counterparts in other countries, according to a 2003 government survey.
- Other studies suggest that a relatively low proportion of men frequent sex workers.
- The small number of intravenous drug users.
- Low rates of ulcerated sexually transmitted diseases, syphilis and herpes in particular. Breaks in the skin surface facilitate HIV infection.
- Most men here are circumcised—some speculate this could be a factor in preventing or reducing infection that would then reduce the risk of HIV.
- Anal sex appears to be less common than in other countries.

In January of 2003, government figures showed that just 1,810 people had tested positive for HIV. The United Nations office on AIDS estimates that the actual number may be closer to 9,400, still an extraordinarily low rate of about 0.01%. In Vietnam, which has a population the same size as

the Philippines, and where the HIV epidemic is still thought to be in its early stages, 130,000 people are already HIV-infected, compared with 9,400 Filipinos with HIV/AIDS. Costa Rica has about the same number of people with HIV and AIDS as does the Philippines, but Costa Rica has only 3.8 million people, not 84.5 million people (Mydans 2003).

### Russia

#### 9. Contraception, Abortion, and Population Planning

*New Abortion Laws* ROBERT T. FRANCOEUR

[Update 2003: On August 11, 2003, Russia increased its restrictions on abortion for the first time since 1936 when the Soviet Union lifted a ban on abortion imposed by Stalin. Abortion is still legal and with no limits in the first 12 weeks of pregnancy; but the new restrictions appear to reflect the first stirrings of a wider debate over the morality of abortion, the effect repeated abortions are having on women's health, and on the demographic future of Russia.]

With contraceptives of any kind unaffordable and more frequently simply unavailable under the Communists, abortion was the common and widely accepted means of birth control, giving Russia one of the highest abortion rates in the world. With the collapse of the Soviet Union came increased availability of contraceptives and a substantial decline in abortions, from a high of 4.6 million in 1988 to 1.7 million in 2002. Apparently, conservative lawmakers are hoping to reduce the number of abortions further with government-imposed restrictions on what has effectively been free and virtually unlimited access to abortion. (See Igor Kohn's comments on the alliance of Communist politicians and hierarchy of the Russian Orthodox Church and their crusade against sexual education and pornography, in Section 3A, Knowledge and Education about Sexuality, and Section 8C, Significant Unconventional Sexual Behaviors, Pornography and Erotica, in the chapter on Russia.)

Before the new restrictions, effective August 11, women could receive an abortion between the 12th and 22nd weeks of their pregnancies by citing one of 13 special circumstances, called "social indicators," including divorce, poverty, unemployment, or poor housing. The government's decision has reduced the number to four: rape, imprisonment, the death or severe disability of the husband, or a court ruling stripping a woman of her parental rights. Being a single mother or a refugee is no longer reason enough to abort a pregnancy after the 12th week.

Under the new law, pregnancies can still be aborted after 12 weeks on medical grounds, including severe disabilities of the fetus or a threat to the mother's life. Although the public's reaction to the new limitations was "strikingly subdued," some lawmakers and leaders of the Russian Orthodox Church welcomed the change and vowed to continue fighting for greater restrictions through new legislation. That threat is causing growing concern among some doctors and in the Russia Family Planning Association that a woman's right to an abortion could soon be curtailed.

Aleksandr C. Chuyev, a member of the lower house of Parliament, who introduced legislation earlier in 2003 to ban all abortions after the 12th week and then took part in negotiations with the Ministry of Health to draft the new restrictions, announced that the new law was "a first step." Chuyev welcomed the restrictions, characterizing them as a compromise. He announced plans to sponsor a new bill later in 2003 that would give a human fetus the same rights as a child.

The nascent antiabortion debate is influenced by the resurgence of religion and the growing influence of the Russian Orthodox Church after 70 years of official atheism under Soviet rule. Russia's demographic crisis is also a factor, as politicians look for ways to reverse the declining population trend. Russia has a total fertility rate of 1.3 children per fertile woman, and a negative 0.33% population growth rate. Although the abortion rate has declined significantly in the past 15 years, there are still nearly 13 abortions for every 10 live births in Russia. Few appear ready to call for an outright ban on abortions, even within the church, but the voices against abortion are growing.

Anatoly A. Korsunsky, the Health Ministry's chief of maternity and childhood health, said in an interview that the new restrictions had been carefully weighed, taking into account the risks repeated abortions carry for a woman's health. Abortions in the later stages of pregnancy and repeated abortions, which are common in Russia, pose the greatest risks to fertility and health generally. In 2002, 40,000 of Russia's 1.7 million abortions were carried out under one of the 13 indicators allowing mid- and late-term abortions. Korsunsky claimed that limiting the circumstances under which these late abortions would be allowed was not intended to force women to continue with unwanted pregnancies, but rather to encourage them to avoid abortions in the first place through traditional family planning and birth control.

The list of 13 social indicators had been in place since they were adopted in 1987. Opponents of reducing the indicators from 13 to 4 opposed the new limits as unnecessary to reduce the number of abortions, given the steady decline that has already occurred.

### Sweden

#### 8. Significant Unconventional Sexual Behaviors

*Prostitution* JAN TROST and ROBERT T. FRANCOEUR

[Update 2003: Prior to January 1, 1999, prostitution was tolerated in Sweden. Prevalent in Stockholm, Gothenburg, and Malmo, pimping was illegal, but seldom reported, and very seldom was anyone sentenced to prison for pimping. At the same time, the police seldom if ever took action against prostitutes or their customers.]

Despite this reality, the Swedish government had long given priority to combating prostitution and human trafficking for sexual purposes. Increasingly, prostitution has been viewed as a form of male violence against women and children, a significant social problem, and a major obstacle to gender equality, so long as men could buy, sell, and exploit women and children by prostituting them.

Since January 1, 1999, when the Act Prohibiting the Purchase of Sexual Services became effective, Sweden has defined prostitution as a gross violation of a woman's integrity. Purchasing or attempting to purchase sexual services is officially a criminal offense punishable by fines or up to six months imprisonment. Women and children who are victims of prostitution and trafficking are considered the weaker party and the victims of exploitation by the procurers and buyers. Under a new law, they do not run any legal risk. "By adopting these measures Sweden has given notice to the world that it regards prostitution as a serious form of oppression of women, and that efforts must be made to combat it" (Ministry of Industry, Employment and Communication 2003). Under the Act Prohibiting the Purchase of Sexual Services, adopted in 1998, a person who obtains casual sex-

ual services in exchange for payment shall be sentenced—unless otherwise subject to more severe penal code punishment—to a fine and six months imprisonment, whether the services are purchased on the street, in brothels or massage parlors, from escort services, or any similar circumstance.

In the four years since enforcement of the new Act began, there has been a dramatic drop in the number of women in street prostitution, according to police and social services. The number of men who buy sexual services and recruit women into prostitution has also fallen. At the same time, public approval of this strict law has risen from 76% in 1999 to 81% in 2002. Opposition to the law dropped from 15% to 14%.

Sweden's current Penal Code provides a maximum penalty of up to four years for anyone convicted of promoting or encouraging or improperly exploiting for commercial purposes casual sexual relations for payment.

According to the International Organization of Migration, at least half a million women are sold annually to local prostitution markets in Europe. According to the National Criminal Investigation Department, between 200 and 500 women arrive in Sweden every year as victims of trafficking. Most of them come from the Baltic, former Soviet Union, and Eastern European countries, after being recruited with bogus offers of work.

In the Campaign Against Prostitution and Trafficking of Women in Sweden, women brought into the country for casual sexual purposes are not subject to being returned to their homeland. They are provided with temporary residence permits and lodging while they testify in court proceedings against their accused procurers and exploiters. In some cases, they are granted permanent residence in Sweden under the terms of the Aliens Act on humanitarian grounds.

Sweden's national campaign is

focused on different measures directed towards buyers and potential buyers of prostituted women and children, mostly girls in Sweden, as well as towards those men who travel to other countries for the specific purpose of buying and exploiting prostituted women and children. The campaign [has] also highlighted, with the long-term objective to ameliorate, the circumstances and conditions that those women and children who are, or who have been, victims of prostitution and trafficking live under (Ministry of Industry 2003).

## Turkey

### 6. Homoerotic, Homosexual, and Bisexual Behaviors

#### Same-Sex Behavior

MEHMET ENIS ODMEN and ROBERT T. FRANCOEUR  
[Update 2003: One of the most sensitive and controversial issues in intercultural discussions arises when one discussant is part of the Western Judeo-Christian cultures and the other person is non-Western—African, Asian, and Islamic/Middle Eastern—and when the topic is the sexual activity between persons of the same sex. The question is not just one of terminology and labeling either the behavior or the person, because it does often involve quite different views of what same-sex behavior connotes when associated with self- or other-identification. Does a male having sex with another male mean that person is what Western people

commonly term a “homosexual,” a person who self-identifies and is identified by others as having a “homosexual identity?” Does this equation make this male somehow *essentially* different from a person who identifies himself as being “a heterosexual.”

As we wrote in *The Complete Dictionary of Sexology* (Francoeur 1995):

Before the mid-19th century, the term “homosexual” did not exist. It was coined in 1869 by a Hungarian physician, Karoly Maria Benkert, writing under the pseudonym Kertbeny. Kertbeny's intention was to create a value-neutral expression to replace value-laden words like “pederaster,” “sodomite,” “bugger,” “catamite,” and “ganymede.” Similar intentions underlay the use of “urning” by Ulrichs in 1862 and “inversion” popularized by Havelock Ellis in the early 20th century, although used earlier. These labels had the advantage of openly disavowing the pejorative meanings of terms like “sodomite” but none of these terms are successful in expressing the rainbow complexities of self-identity.

One problem is that *homosexual* can be an adjective or a noun. As an adjective in the sentence “Mutual penile masturbation by two men is a homosexual act,” the word *homosexual* indicates the basic concept of sexual activity between people of the same sex. But it leaves unclear what acts are and are not to be called homosexual. If a man kisses another man when greeting him in a gay bar, is that a “homosexual kiss”? The usage here varies immensely and many would say “Yes” or “No” depending on whether or not the men self-identified themselves as “gay.”

Use of the word “homosexual” as a noun referring to a person who engages in a certain act or experiences a certain emotional state of sexual attraction or limerence (qv) with a person of the same gender. Few concepts are as difficult to define, or to defend once defined, as the assertion that someone “is” a homosexual. If, at age 15, a woman engaged in erotic caresses with another woman, “is” she a homosexual? A question such as this poses three crucial problems in defining homosexuality and, by extension, heterosexuality as well. (1) Labelling someone “a homosexual” in his or her entirety because of a possibly small portion of their overall life and existence is using a part to define the whole. (2) It is an arbitrary term that is not subject to defensible definition: how many homosexual acts constitute a person “a homosexual.” (3) It also represents a dangerous philosophical essentialism to speak of a person as “being” a homosexual or heterosexual because in so doing we impute to that person's essential nature a certain quality or characteristic when it is still questionable what human nature really is. (Francoeur 1995, 281)

All of which is an essential prelude to our discussion of some participant-observer comments about sexual behavior offered by three Western males who identify as homosexual or gay with personal experiences with same-sex behavior in Turkey. The comments that follow are from brief chapters by Janssen, Neecef, and Sofer in *Sexuality and Eroticism among Males in Moslem Societies*, edited by Arno Schmitt and Jehoeda Sofer (1992). This discussion is particularly relevant in light of similar observations of same-sex behaviors in Section 6, Homoerotic, Homosexual, and Bisexual Behaviors, in the chapter on Iran and Herb Samuels' brief report on “Down Low African-Americans” in Section 6B, Homoerotic, Homosexual, and Bisexual Behaviors, Adults, Health Issues, in the United States chapter. In the simplest terms, African-American men on the “Down Low” who sleep with men are “heterosexual.”

In the rural areas of Turkey, Morocco, Egypt, Iran, Turkey, and other cultures where patriarchal tribal societies prevail, there is little room for the development of *personal individuality*. Almost everything is predetermined in the rural society. In rural cultures, one thinks of one's self and others think of that person in relation to other people and groups, not in terms of a person's sexual behavior. He is the son of a father and a mother. In Turkey, he addresses his father and mother as *baba* and *anne* (or *ana*) all his life. It would be inconceivable for a Turk to call his (or her) parents by their given names. Turks are also expected to add the words *abi* or *abla* to the names of their older brothers and sisters to show respect. Parents seldom leave room for initiative. A parent asking a child which ice cream it wants is very exceptional. To put it bluntly: A Turkish boy grows up under the wings of his elder family members, marries the woman recommended by them, works industriously for his family, fights fanatically for his cause, and dies bravely for his country and flag (Janssen 1992; Necef 1992; Sofer).

But, in the bustling metropolitan urban life of Istanbul's 8.5 million people, surrounded by the 7 million inhabitants of Cairo or Tehran, or even the 3 million people in Casablanca or Ankara, a "city man" can develop a concept of self-identity or self-identified ego similar to that found in gay communities in Europe and North America. In big cities, one can find a homosexual subculture with discotheques, bars, beaches, and so on. Compared with the West, or even with Greece, homosexual self-identity is still underdeveloped. In spite of all this, the role and self-identity of "homosexual" does exist in the big cities at least. For individuals to develop the role and identity of "a homosexual" and for society to recognize this self-identification—to accept it in whatever manner—requires a certain social climate. The big cities with less rigid control by family and neighbors—a certain anonymity—less personal dependence, more reliance on impersonal society (social security instead of family or patron), and more privacy offer this climate.

One typical aspect of the Turkish scene is the importance of role-playing: some men acting or dressing up like women and others underlining their masculinity. It is still *ibne* and *kulampara* rather than "gays" and "straights." Transvestism plays a much larger social role in Turkey and southern Europe than in the north or the U.S.A. This seems to be the result of relations between the sexes. Turkish men and women almost live in two different worlds. The homosexuals are just aping a different side of the "normal" world.

The word *homosexual* entered the Turkish vocabulary by translations from European languages, first as *homoseksüel*. During the Turkification of the language after the foundation of the republic in 1923, the word *elcinsel* (equal-sexual) was coined, but this did not fit the roles and identities in Turkey, and confusion arose.

The existing roles for sexual relations between men were *ibne* and *kulampara*. An *ibne* is an effeminate man who plays the passive or recipient role in anal intercourse. He does not marry, because he is thought to be impotent. An *ibne* can be a transvestite, earning his living by dancing, singing, or prostituting himself. To be an *ibne* is the worst thing a Turkish man can be, for two reasons. First, because he accepts anal intercourse "like a woman" and second because he moves and speaks in an unmanly manner.

Given these views, it may come as a surprise that the most popular (male) singers in Turkey are transvestites (*ibneler*). Turks explain their admiration for these artists by pointing to their artistic talent and to the fact that nearly all artists are crazy and strange. All these singers interpret heterosexual love songs (though in some cases the sex of the loved one is unclear). They also even act in films playing the role of a straight lover.

The other role is played by the *kulampara* ("having to do with boys"). A *kulampara* is over age 16 and nearly always married. Like all Turkish men, he is expected to marry after military service at the latest. But because of the brideprice still required in rural Turkey, some poor peasants marry later.

In contrast to *ibne*, the *kulampara* does not constitute a special type of man, a "homosexual" or "gay man" in the Western sense. Any married man "too full of lust" or separated too long from his wife looks for prostitutes, mistresses, animals (dogs and donkeys), or an *ibne*. Nobody would consider himself as "abnormal," "perverse," "sinful," let alone "homosexual" for having anal sex with an *ibne*. Behavior does not dictate self-identity. To have anal intercourse with an *ibne* is an enjoyment open to all men. Any man could be seduced by an *ibne*.

Conversations with Turkish men show that sexual play with other men plays a rather important role in young men's sex life, especially in rural areas. While still young, playing the passive (recipient) role in anal sex apparently does not disturb them unduly. After marriage, most men are exclusively heterosexual.

# Global Trends: Some Final Impressions

from *The Continuum Complete International Encyclopedia of Sexuality*

Robert T. Francoeur, Ph.D., and  
Raymond J. Noonan, Ph.D.

Our role as editors of *The Continuum Complete International Encyclopedia of Sexuality (CCIES)* has been carefully limited to recruiting scholars who could report with some authority about the sexual attitudes, values, and behavioral patterns of a particular country or some particular aspect. We provided them with our standard content outline, and left them free to write. We then copyedited their manuscript without altering in any way their thoughts, although we did seek clarification when necessary and encouraged them to fill in any gaps we found. In the case of chapters in volumes 1 to 3 published in 1997 and volume 4 published in 2001, we invited the original authors and some new authorities to update these chapters. Sometimes, we sought—or inadvertently found—scholars with alternative perspectives or interpretations who broadened an entry with commentary. As editors, our role has been that of a catalyst—to facilitate bringing together those with the broadest possible perspectives to enrich the product.

At the same time, as we read and reread these chapters and exchanged communications with the authors, we could not help but be impressed by some similar developments in different countries, some common threads of changing attitudes and behavioral patterns. Sometimes, we found these similarities in survey results or commentaries by the authors or updaters. At other times, a specific seemingly minor local event reported first in the local media caught worldwide attention, signaling what might become a cultural turning point. Whether we were impressed by a general broad-based trend, like the plummeting birthrates around the world, or one of the local events noted below, they all seem to suggest that, today, at the dawn of the 21st century, the human race is engaged in the biggest sexual revolution in at least 5,000 years. It will be far more radical in its consequences than the geographically limited revolutions of the Roarin' Twenties and the 1960s-1970s, although each had a progressively greater impact through the dissemination of American popular culture through the media. Unlike those revolutions, which at first mainly affected North America and Europe, this new revolution is stirring in large and small, rich and poor, agrarian and industrial nations all around the world. Fueled by television and the print media, by economics and technology, by medical and reproductive advances, and by the Internet, it is racing along in Europe and North America. But it is also sprouting all over Africa, Latin America, and Asia, where it is shaking up traditional views of sex, the way men and women relate, our patterns of sexual intimacy, as well as the way we bond, marry, and create families.

Our work on these reports on 62 countries and places—one quarter of all the nations in the world, including China, India, Japan, and key countries in Europe, the Americas, and Africa—has left us convinced that this new sexual revolu-

tion is being led less often by males who have dominated civilizations worldwide for the past several thousand years, but by women, who are taking a more-public stance for more gender equality—and sometimes to gain dominance. For thousands of years, males largely have created and controlled the technological advances that triggered all the minor Euro-American sexual revolutions of the past. Five to eight thousand years ago, men restructured the whole of human society and male-female relationships, when our ancestors discovered agriculture, domesticated animals, invented the wheel, smelted bronze for tools and weapons, and created alphabets to record their history, laws, trade agreements, and treaties. When men built the first cities in the Middle East, Egypt, and the Indus Valley, they created a new lifestyle: Men held most of the power and women became the subordinate sex relegated to the private world of baby-maker and homemaker. The equality men and women had enjoyed in earlier, nomadic hunter-gather societies disappeared in the male-controlled world of ancient city life. In this urban hierarchy, women had three faces, the *Trevia* of virgin maiden, wife/mother, and whore. A good woman's value depended on her premarital virginity, her marital fidelity, her production of male heirs, and catering to men's needs.

Over the centuries, men invented ever faster, easier, and cheaper ways to communicate and travel. Males drove the medical technologies that improved our health and more than doubled human life expectancy in a brief century. Male-driven science and technology gave many of us the increasing leisure, mobility, and affluence essential for the occasional minor sexual revolutions that have come our way. Forty years ago, male scientists, urged on by Margaret Sanger, developed antibiotics to control sexual diseases and the contraceptive technologies that have given women, for the first time in human history, the freedom to enjoy sex without the fear of an unwanted pregnancy.

Obviously, our years of work on *CCIES* have left us with some controversial conclusions, with which our readers may or may not agree. This is not the place to debate the validity of our observations. We will only suggest some reasons for them. Only the future will confirm or refute our observations and forecasts. And so we conclude *CCIES* with some highlights encountered along the way. Agree or disagree. Add or reject. We invite our readers to join us in looking to the future.

We begin with a brief look at economics, education, and gender—with Japan in the east, Scandinavia in the west, and the Middle East and North Africa in-between. In 2003, as noted in our chapter on Last-Minute Developments, Japan ranked 69th out of 75 member nations of the World Economic Forum for its record of empowering women. While 40% of Japanese women are employed outside the home, only 9% hold managerial positions. In Scandinavia, women hold slightly less than a third of the managerial positions, but less than 10% of the positions on corporate boards. In 2003, Norway passed a law requiring corporations to raise the percentage of female board members from the then 9% to 40% by 2007, or face stiff penalties. Sweden, with 30% female corporate board members, was planning to follow Norway's example. (In the U.S., women hold 46% of the board memberships.) In 2003, the first woman to serve on the board of the Bank of Japan warned that "Japan has gone as far as it can with a social model that consists of men filling all of the economic, management and political roles."

At the same time, the World Bank was pointing out a similar tension with warnings that women remain a "huge, untapped" economic resource in the Middle East and North Africa, where more women workers are needed to transform economies that must depend increasingly on private-

sector exports to compete worldwide. Despite the fact that women make up half the 325 million people in these regions, and in some countries as many as 63% of university students, they comprise only 32% of the labor force, according to the World Bank report on "Gender and Development in the Middle East and North Africa: Women in the Public Sphere." According to the World Bank's vice president for the Middle East and North Africa, "No country can raise the standard of living and improve the well-being of its people without the participation of half of its population. Experience in other countries has shown over and over again that women are important actors in development."

In the 19 countries of the Middle East and North Africa, women's workforce participation is "lower than would be expected on the basis of the region's fertility rates, education levels and the age structure of the female population," the World Bank report found. It is less than half the 74% rate in the Asia and Pacific region, with their successful exporting countries, where women have played a pivotal role in emerging industries. With improved health and education, one of every three women in the Middle East is 30 years old or younger. But these younger women are likely to face greater obstacles in finding a job and playing an active public role in their societies than their contemporaries elsewhere. There are far-reaching economic and social consequences when men who find their self-image in being the breadwinner for the family discourage women from employment outside the home. Middle East and North African countries have the highest proportion of dependents to wage earners in the world. Each wage earner in these regions supports more than two nonworking dependents, a problem that cannot be counteracted even by lowering unemployment rates.

Along with the gender differences in employment, one needs to consider, also, the growing gender differences in education. These educational differences were highlighted in the annual survey of educational policy issued by the Organization for Economic Cooperation and Development, which concluded that young women are steadily moving ahead of their male peers in educational achievement and aspiration. "In most OECD countries, young women are now more likely than young men to obtain first degrees from university-level institutions. Only in Japan, Switzerland and Turkey is the proportion of young men obtaining their first university-level degrees significantly higher for young men than for young women." On average, females now make up more than two-thirds of the graduates in the humanities, arts, education and health studies. In mathematics and computer science they account for less than a third, and in engineering about a quarter. According to the report at age 15, girls were better readers than boys in every one of the 43 countries that took part of the 2000 study. In about half of these countries, boys were ahead in mathematics. As a consequence, in most OECD countries, females expressed higher expectations for their future occupations than males.

These higher expectations are an important factor in our future. It has meaning for young men and women in Japan, the Middle East, North Africa, and the West. In Japan, for instance, young women are increasingly expressing their anger with chauvinist and nonproductive males. "I would like to get married, but I don't want to lower my living standard" is a typical position of young Japanese businesswomen who live with their parents and frequently travel abroad. The number of unmarried men and women over age 39 has doubled in 20 years. Japan's birthrate is 1.4 children per childbearing woman and shriveling like a dried prune.

With these observations in mind, we can move on to briefer mentions of our other observations:

- Continued rapid globalization and technological development will escalate anxieties, tensions, and open conflicts for people and societies rooted in fundamentalist, traditional, agrarian, patriarchal value systems, as television, the Internet, and daily physical contact exposes them to the more-permissive, gender-equal, and individualistic values of industrial and postindustrial Western societies. The currents of enculturation are already working in both directions, with both agrarian and industrial societies caught in the maelstrom of rapid change.
- In Iran, a very fundamentalist Islamic country ruled by very conservative religious leaders determined to keep women in their place, are encountering repeated opposition from the younger college-educated generation, including the daughters of leading moderate government officials. With Revolutionary Guard everywhere, one would hardly expect teenage "infidel" girls in high tops, tank shirts, bare midriffs, and jeans to risk arrest by hanging out on city streets. Where did these rebellious teenagers pick up their "satanic" fashions and the courage to wear them in public? Answer: By 1994, a quarter of a million Iranians were watching popular Western television programs beamed down from satellites to low-tech dish antennae and decoders hidden in their apartments and shared with neighbors, despite threats by the Ministry of Culture and Islamic Guidance.
- In Africa, where nearly 70% of the world's HIV-infected people live, most new victims are women infected by their husbands who are accustomed to having a "home-wife" and one or more "traveling-wives" for company while they're away at work. With a burgeoning feminist movement pushing to transform these sexual politics, the AIDS crisis is forcing African men to listen to their women, and that empowers women. Women in Kenya have enlisted the aid of Anglican Church leaders to reduce and eliminate "sexual access" to widows who are "inherited" by a male relative of the deceased husband. Although not easily, and with resistance from some feminists, new laws and healthy alternative rituals are being adopted to replace female genital mutilation.
- In Latin America, Peruvian women have enthusiastically endorsed a government campaign to make contraception available to all women, especially the poor. In a nation where 90% of the people are Catholic and many rural women have 10 or more children, Peru's women are ignoring the Pope's ban on contraception and asserting their right to control their own sexual and reproductive lives.
- In Islamic northern Nigeria and in Pakistan, several young women who claimed they were raped—and named their assailants—have triggered international human rights protests when the media publicized that they were tried and convicted of fornication and sentenced to death by stoning. Islamic law requires four adult males be present to witness the rape in order to prove it had taken place.
- Worldwide, the media reported increasing challenges to the traditional marriage arranged by parents or family: In Upsala, Sweden, in 2002, the "honor killing" of 26-year-old Fademi Sahindal by her father, when this Kurdish woman announced she would marry her Swedish lover, provoked international outrage.
- In May 2003, India's television and print media propelled Nisha Sharma, a 21-year-old computer student, to Hindi stardom as a "New Age woman and role model" for the nation's young women. Ms. Sharma called off her wedding after the groom's family demanded a dowry of \$25,000 in addition to the gifts al-

ready received from the bride's family. Ms. Sharma reported the groom to the police, who put him in jail pending formal charges that he and his mother had violated India's laws against dowries.

- In Thailand, pioneering single women are choosing to buck social and family traditions by living on their own when they cannot find a nonchauvinist husband. Many of them are even having a child by a lover who lives on his own.
- In Algeria, Muslim women are turning to personal ads to find mates of their own choice, despite strong family disapproval and censorship by fundamentalist Islamic men.
- There is a growing tradition of financially established single Italian men, "mammoni," to continue living with their parents into their 30s, 40s, and beyond, instead of marrying and moving out on their own. This, plus a birthrate below 1.1 child per fertile woman, are radically changing the traditional Italian extended family. Italian

husbands and Catholic bishops complain that the Italian women are not listening to them anymore. So many Italian women, married and unmarried, are using the pill and having abortions, that Italy now has the lowest birthrate of any nation in the world.

- China has been widely condemned for its one-child-per-family policy, forced abortions, and female infanticide. But because these policies have also created a serious surplus of males, young Chinese women are enjoying an unexpected change in bargaining power and choice in picking the best possible husband.
- Meanwhile, an unmarried Polish woman begged a doctor for an illegal abortion and created a national movement to legalize abortion when her ex-lover reported her and the doctor "to teach her a lesson."
- In Ireland, a 14-year-old girl who tried to go to England for an abortion forced the government to allow at least some abortions. With one in six Irish marriages ending in separation and 75,000 broken marriages, President

### *In Memoriam*

#### *Dr. David Lee Weis*

**friend, colleague, teacher, and sexologist,  
who died of diabetes complications at age 52 on September 5, 2003**

David Weis was a major contributor and coeditor of the United States chapter in *IES* (volume 3; 1997), the 1998 updated *Sexuality in America: Understanding Our Sexual Values and Behaviors*, and in the 2003 U.S.A. update in the present expanded single-volume *Continuum Complete International Encyclopedia of Sexuality*.

In late August, when David emailed us the last of his major summaries and updates for *CCIES*, we called to thank him for his usual lucid and penetrating summaries. We were delighted with his contribution, and he was happy with our delight. Two weeks later, we were formatting and integrating his contributions when a family friend called with news of his totally unexpected death. We will miss him as a friend and as a colleague. Our field will be diminished by his loss.

David was professor of family and consumer sciences at Bowling Green State University, where he was well known for his keen intellect as well as his sense of humor, "bubbling forth with ideas and stories to share with colleagues and students alike." "As brilliant and committed as Dave's professional contributions have been," one of his students observed, "he always extended generous support of us newcomers with humility and genuine interest. The world is less bright without his warmth and wit."

Besides coordinating the contributions of three dozen other American sexologists for the original U.S.A. chapter, Dave provided his own major summaries of the latest research on childhood, adolescent, and adult sexual behavior. His history of "Change, Conflict, and Diversity" in the U.S.A. chapter provided an organizing theme for that chapter/volume.

David was, in the words of Ira Reiss, one of America's leading sexologists and sociologists, "a talented thinker and researcher who contributed much to the sociological analysis of sexuality." Not long after joining the Society for the Scientific Study of Sexuality, Dave won the prestigious Hugo G. Beigel Research Award for outstanding article of the year in the *Journal of Sex Research*. The Beigel Award was given to Dave in 1984 for a research paper on affective reactions of women to their initial experience of coitus. In 1998, Dave edited a special issue of the *Journal of Sex Research* on Theory in the Study of Sexuality.

As Candace Blake Weis, his wife, knew better than we, "He loved intellectual challenge, and he had a great knack for having a different perception than most people. He loved his students. He would have active discussions in the classroom, sometimes about sensitive and controversial subjects, and there were lively discussions."

A Toledo, Ohio, native who grew up in the Cleveland area, David received his bachelor's degree in health and physical education from Bowling Green State University (BGSU) in 1973, a master's degree in family studies from Purdue University in 1976, and a Ph.D. from Purdue in 1979. After seven years teaching at Rutgers University in New Jersey, he returned to teach at BGSU. In 2001, David was named as one of BGSU's 25 most-accomplished graduates.

We dedicate this edition of the *Continuum Complete International Encyclopedia of Sexuality*, in which David played a major role, to his memory, with our sympathy to his wife, Candace Blake Weis, his daughter, Rebecca Weis, and his parents and two brothers and two sisters.

We will miss him.

ROBERT T. FRANCOEUR, TIMOTHY PERPER, MARTHA CORNOG,  
RAYMOND J. NOONAN, and the other members of the *CCIES* team

Mary Robinson pressed for a referendum to lift the constitutional ban on divorce and allow women some relief in alimony and child support.

- Fifty thousand women attended the Fourth World Conference on Women in Beijing. Women from many nations eloquently claimed the right to control their sexual and reproductive lives, equal inheritance rights, access to credit, and freedom from violence. In the end, the women of Africa, led by Namibians, forged a compromise that blocked the Vatican's proposal to excise the words "sexual freedom" from a particular document. As one observer commented, "It's shocking to find African countries more progressive than others."
- There is a continued shift away from a procreative morality and motivation for sex to a relationship- and pleasure-based morality.
- Increasing popularity of hormonal contraception, the morning-after pill, condoms, and new contraceptives are facilitating the shift to lower fertility rates, lower teen-pregnancy rates, and increasing rates of nonmarital sex, especially for women. In both developing and industrial/postindustrial societies, women are increasingly taking responsibility for preventing unwanted pregnancies, and for initiating a nonmarital relationship.
- Increasing years between puberty and the age of marriage make premarital sexual abstinence increasingly more difficult and unlikely.
- A continued increase in life expectancy and erosion of the sexual double standard are making men and women equally as likely to experiment with extramarital sex and to divorce and remarry or remain single. Men and women continue to experiment with extramarital relations earlier, more often, and with more partners than in the past.
- In Finland, the popularity of both marriage and cohabitation are declining. Two national surveys, in 1972 and 1993, show that the fastest-growing lifestyle is LAT, couples "living alone together" (in a sexual relationship). In these same surveys, LATs report being much happier with their personal and intimate lives than married or unmarried cohabiting couples. Similar trends have been reported in Germany and elsewhere.
- There is increasing recognition of the rights and needs of sexual minorities, the elderly, and those who are disabled or handicapped. The "graying" of Europe and America is paralleled by developing nations like Iran and Costa Rica with a third or more of their population 14 years old or younger.
- There is a spreading recognition and acceptance of protected sexual relations and the promotion of protected sex, as the shift from agrarian to urban life continues.
- There is growing social, legal, and religious acceptance of homosexual, bisexual, transgendered, and gender-variant persons.

Conclusive evidence of a global sexual revolution underway and led primarily by women? Certainly not, if taken individually. But we will leave it to our readers to judge the cumulative weight of these and other developments found in the *CCIES*.

Around the world, women are demanding and getting countless, often unnoticed social changes that, taken together, create an irresistible tidal wave no one can long escape. Around the world, the ways in which women and men relate are shifting gradually toward a new gender equality that will inevitably also change our marital relationships and family structures. The spread of manufacturing and technological development has brought women in many developing nations a growing financial and psychological independence that in many small but important ways helps them take increasing control of their own lives and set their own goals.

Obviously, societies do not change overnight. Patriarchy is not going to disappear overnight, and perhaps not in the foreseeable future, but just maybe, an irresistible tide is shifting, away from male dominance toward a growing equality of the sexes. At least, that is our hope.

To be sure, many men are participating with women in effecting many of these changes. At the same time, many men—and women—are noting the excesses that have been accumulating in at least the United States, which we are also exporting to the rest of the world in our popular culture. The best example is that of sexual harassment, which has become grossly misused and distorted from the original problem. And there are other indications that when women get power, they are just as likely to abuse it as men. The United States is no longer a patriarchal society, if it ever was. Yet, many Americans believe it still is, because sexual politics have transformed it through its use as a metaphor to a perceived reality—and that is not helpful in achieving our goals.

Thus, we need to avoid the simplistic traps that remain all too common. The human sexuality complex exists in an environment that has multiple forces that act on it—in much the same way that it influences them reciprocally. Politics remains an undeniable obstacle to real progress on a global level while it simultaneously provides the means for redressing the inequities of the past. Yet, solutions that merely shift the inequities to men are not a long-term solution; they just exacerbate the crises. Solutions that demonize men's sexuality while extolling women's sexuality are doing the same. This is the sexual counterrevolution noted by John Money in the epilogue to the United States chapter that is currently underway in this country. And that is counterproductive as a long-term strategy.

For real lasting change to occur that benefits both sexes requires a joint effort of both women and men working together for the common good. The current situation of social groups working toward and promoting only their own self-interests and empowerment needs to change on a global level so that sex enriches the lives of everyone.

## *The Editors*

**ROBERT T. FRANCOEUR, M.A., M.S., Ph.D.** Trained in embryology, evolution, theology, and the humanities, Dr. Francoeur's main work has been to synthesize and integrate the findings of primary sexological researchers. He is the author of 22 books, contributor to 78 textbooks, handbooks, and encyclopedias, author of 58 technical papers on various aspects of sexuality, and editor-in-chief of *The Complete Dictionary of Sexology* (1991, 1995). A Fellow of the Society for the Scientific Study of Sexuality, he is professor emeritus of human sexuality at Fairleigh Dickinson University, Madison, New Jersey, USA. In 2003, Dr. Francoeur joined the National Advisory Council for implementation of the former U.S. Surgeon General David Satcher's *Call to Action to Promote Sexual Health and Responsible Sexual Behavior 2001*. 4310 Cleveland Lane, Rockaway NJ 07866-5811 USA; rtfrancoeu@aol.com

**RAYMOND J. NOONAN, Ph.D.**, is an assistant professor of human sexuality and health education, and chairperson of the Health and Physical Education Department at the Fashion Institute of Technology of the State University of New York (FIT-SUNY) in Manhattan. Dr. Noonan has written and presented on sexuality in the environment of space, sexuality and the Internet, philosophy and sex, heterophobia and sex negativity in American culture, and sexual expression in musical lyrics. He was coeditor of *Does Anyone Still Remember When Sex Was Fun? Positive Sexuality in the Age of AIDS* (3rd ed., 1996). He also produces SexQuest.com, providing educational consulting in human sexuality and educational content for the World Wide Web. Health and Physical Education Department, FIT-SUNY, 27th Street and 7th Avenue, New York, NY 10001 USA; 212-217-7460; rjnoonan@SexQuest.com

## *Associate Editors*

**Africa:** BELDINA OPIYO-OMOLO, B.Sc., is a graduate student in the Master of Public Health program at East Stroudsburg University in Pennsylvania, USA, and a member of the Luo people of Kenya. Ms. Opiyo-Omolo provided extensive network connections with Africans dealing with sexuality and contributed major updates and comments on Kenya, Nigeria, Ghana, Tanzania, and other subequatorial African nations. bopiyo@yahoo.com

**Europe:** JAKOB PASTOETTER, Ph.D., is former Deputy Director of the Magnus Hirschfeld Archive for Sexology at Humboldt University (Berlin), and a member of the Governing Board of the German Society for Social Scientific Sexuality Research. Dr. Pastoetter authored the chapter on Vietnam, updated the chapter on Germany, and personally recruited several key European and African chapters for the *Continuum Complete International Encyclopedia of Sexuality (CCIES)*. Duenzelbach 10, 82272 Moorenweis, Germany; jmpastoetter@compuserve.de

**Latin America:** LUCIANE RAIBIN, M.S. A native of Brazil, Raibin earned a B.S. and M.S. degree in biology at Fairleigh Dickinson University, Madison, New Jersey, while studying human sexuality with the *IES/CCIES* Editor. As associate editor, she facilitated correspondence with contributors in Colombia, Cuba, and other Latin American countries, provided updates for Brazil, and assisted with translations.

315 South Avenue, Garwood, NJ 07027 USA; L.Raibin@hotmail.com

**Information Resources:** TIMOTHY PERPER, Ph.D. Besides writing the Preface for *IES/CCIES* and a major discussion on Japanese *manga* for *CCIES*, Dr. Perper provided invaluable advice and helpful discussion on sensitive issues. Dr. Perper is author of *Sex Signals: The Biology of Love*, coeditor of *The Complete Dictionary of Sexology*, and coauthor with his wife, Martha Cornog, of several major texts on sexuality. 717 Pemberton, Philadelphia, PA 19147 USA; perpcorn@dca.net

**Information Resources:** MARTHA CORNOG, M.A., M.S., is a linguist and librarian. Ms. Cornog was a reliable source of advice and information for *IES* and *CCIES*. She is coauthor with her husband, Timothy Perper, of the award-winning *For Sex Information: See Librarian*, coeditor of *The Complete Dictionary of Sexology*, and editor of *The Big Book of Masturbation from Angst to Zeal*. 717 Pemberton, Philadelphia, PA 19147 USA; perpcorn@dca.net

## *Authors of Individual Chapters*

### **Preface:**

TIMOTHY PERPER, Ph.D. is a Philadelphia-based independent sex researcher and writer, behavioral biologist, expert on human courtship and flirtation behaviors, author of *Sex Signals: The Biology of Love* (1985), coauthor of *For Sex Education, See Librarian* (1996), author of numerous professional articles on human sexual behavior, an elected fellow of the American Anthropological Association, and coauthor of a *Sexuality and Culture* monograph, *Eroticism for the Masses: Japanese Manga Comics and their Assimilation into the U.S.* 717 Pemberton, Philadelphia, PA 19147; perpcorn@dca.net

### **Introduction:**

IRA L. REISS, Ph.D. Professor of sociology at the University of Minnesota, Dr. Reiss is former president of the International Academy of Sex Research, the National Council on Family Relations, and the Society for the Scientific Study of Sex, recipient of the 1990 Kinsey Award for Distinguished Scientific Achievement, and author of eleven books and more than a hundred professional articles. His latest books are *Journey into Sexuality: An Exploratory Voyage*, *An End to Shame: Shaping Our Next Sexual Revolution*, and *Solving Sexual Crises: Rape, AIDS, Child Sexual Abuse, Teen Pregnancy*. 5932 Medicine Lake Road, Minneapolis, MN 55422 USA; reiss001@atlas.socsci.umn.edu

### **Argentina:**

SOPHIA KAMENETZKY, M.D. A native of Argentina, Dr. Kamenetzky has dedicated herself to increasing the sexual knowledge of women and organizing sexual education courses. Postgraduate studies in France and study visits to African, Asian, and Latin American countries provided her with an understanding of the roles and problems of women in different societies. Former medical advisor and director of public relations with Latin American Universities for the Population Information Program (at George Washington University, Washington, DC), she facilitates seminars on sexuality and the role of emotions in the health of the immune system. P.O. Box 352530, Palm Coast, FL 32135-2530 USA; mkamen@aol.com

### **Australia:**

ROSEMARY COATES, Ph.D. Inaugural president and Honorary Life Member for the Western Australia Sexology Society, Dr. Coates is an associate professor of physiotherapy in the Division of Health Sciences at Curtin University, Western Australia, and vice-president of the Family Plan-

ning Association of Western Australia. She is author of *Sexual Awareness Manual*, *Teacher's Survival Manual*, and comparative studies of sexual knowledge, attitudes, and behavior among college-aged people. Curtin University, Shelby Street, Shenton Park, Western Australia 6008, Australia; icoatesr@info.curtin.edu.au

**Updates:** TONY WILLMETT, R.E., M.A., Ph.D., a member of the Faculty of Education, Australian Catholic University National and consultant in the area of human relationships education, he is author of *Catholic Schools Australian Landscapes: Resources for Creating Distinctive Catholic Schools and Relationships and Sexuality*. School of Religious Education, Australian Catholic University National, McAuley at Banyo Campus, P.O. Box 456, Virginia. Queensland 4014, Australia; t.willmett@mcauley.acu.edu.au

### **Austria:**

DR. ROTRAUD PERNER, L.L.D. Founder and director of the Training Program for Sexual and Social Life Counselors (GAMED), Vienna Academy for Holistic Medicine, and director of the training program for sexual and social counselors at the Verein fuer Prophylaktisches Gesundheitsarbeit (Association for Prophylactic Health Work), Linz, Dr. Perner holds diplomas in psychoanalysis and systematic sexual therapy plus five other psychotherapeutic-related diplomas. She is currently first chairperson of the Austrian Society for Sexology and a member of the University of Vienna Department of Education. 8633 Weichselboden 20, Stmk. 1013 Wien, Postfach 23, Austria; rotraud.a.perner@chello.at

**Updates:** LINDA BRAILOVE KNEUCKER, a family and sexual counselor activist for the rights of children and the reduction of child sexual abuse, provided translation, redaction, and updates for the Austrian chapter. kneucker@magnet.at. RAOUL KNEUCKER, retired science administrator of the Austrian federal government, now works on a new program for public understanding of science. Raoul.Kneucker@gmx.at. MARTIN VORACEK, Ph.D., M.Sc. Univ.-Klinik für Tiefenpsychologie und Psychotherapie AKH/Währinger Gürtel 18-20, A-1090 Wien, Austria. martin.voracek@chello.at

### **Bahrain:**

JULANNE MCCARTHY, M.A., M.S.N., holds a Master's degree in anthropology from Indiana University (Bloomington campus), and a Master's degree in adult health nursing (University of Illinois-Urbana). After nine years working in a Bahrain hospital, she researched and wrote the Bahrain chapter with insights and observations provided by twenty Bahraini professionals and eight expatriates in a variety of disciplines, as well as with anecdotal insights from personal contacts and local popular print media.

### **Botswana:**

GODISANG MOOKODI is a lecturer in the Development, Gender, and Families in the Department of Sociology, University of Botswana.

OLEOSI NTSHEBE is a postgraduate student at the University of Botswana, conducting research on the sexual health of the Basarwa.

IAN TAYLOR, Ph.D., is a lecturer in African politics in the Department of Political and Administrative Studies, University of Botswana. Department of Political & Administrative Studies, University of Botswana, Private Bag 00705, Gaborone, Botswana; tayloric@mopipi.ub.bw

### **Brazil:**

SÉRGIO LUIZ GONÇALVES DE FREITAS, M.D. President of Associação Brasileira de Sexologia (AB-SEX), Scientific Director of the Sociedade Brasileira de Estudos

da Impotencia Sexual, Dr. Freitas has also organized three National Sexological Conferences in Brazil and the First Pan-American Congress of Sexology in 1986. A gynecologist and surgeon, he has served 22 years in the National Institute of Public Health (INSS), where he founded the Department of Sexology in 1986 and *The Journal of Sexology*. Associação Brasileira de Sexologia, Rua Tamandare 693-Conj 77 01525-001, São Paulo, SP, Brazil.

LOURENÇO STÉLIO REGA, M.Th. Professor Rega's research interest is in the anthropological perspectives of sexual ethics. Author of *Perspectiva Crista do Sexo* (1990) and *Libertação e Sexualidade, uma Abalise* (1991), he is a professor of sexual and medical ethics and Dean of the Baptist Theological Faculty of São Paulo.

ELÍ FERNANDES DE OLIVEIRA, Eli Fernandes combines his theological and psychological training as a counselor working with couples, children, and homosexuals. He is president of the São Paulo Baptist Convention and pastor of the Baptist Church of Liberty in São Paulo.

**Updates:** LUCIANE RAIBIN, M.S., and RAYMOND J. NOONAN, Ph.D. (see listings above, Associate Editors and Editor), and Dra. SANDRA ALMEIDA, who is a Brazilian lawyer and women's rights advocate currently living in New York.

### **Bulgaria:**

MICHAIL ALEXANDROV OKOLIYSKI, Ph.D. With a doctorate in rehabilitation science (from Humboldt University, Berlin), Dr. Okoliyski helped organize and presented at a wide variety of European and Bulgarian conferences and programs. His main interests include AIDS prevention and epidemiology in Bulgaria, gathering data on Bulgarian sexual behavior, and prostitution and sex tourism in Bulgaria. In 1994, he cofounded the Human Sexuality Research Foundation. National Center of Public Health, Sophia, Bulgaria; mental@mbox.cit.bg.

PETKO VELICHKOV, M.D., has done some research and mostly clinical work in sexuality, offering postgraduate training for medical specialists and an elective/optional course for medical students in the field of human sexuality. In 1994, Dr. Velichkov cofounded the Human Sexuality Research Foundation in Sofia; he has been the Foundation's executive director since then. Human Sexuality Research Foundation, 16, Kosta Lulchev Str. bl. 244, Sofia 11113, Bulgaria; sexology@acad.bg; www.sexology.bol.bg

### **Canada:**

MICHAEL BARRETT, Ph.D. Professor of zoology at the University of Toronto in Ontario, Canada, Dr. Barrett is Chairperson of SIECCAN, the Sex Information and Education Council of Canada, and the author of *Population and Canada*. He has also published studies on sexual experience, birth control usage, sex education, and abortion in Canada. University of Toronto, Zoology Department, 25 Harbord Street, Toronto, ON, M5S 3G5, Canada; barrett@zoo.utoronto.ca

ALAN KING, Ph.D., is director of the Social Policy Evaluation Group at Queen's University, Kingston, Ontario, Canada.

JOSEPH LEVY, Ph.D., is a professor in the Department of Sexology at the University of Quebec at Montreal and a leading expert on sexuality among the French-speaking peoples of the Quebec Province. Levy.joseph\_josy@uqam.ca

ELEANOR MATICKA-TYNDALE, Ph.D., is a member of the Department of Sociology and Anthropology at the University of Windsor in Ontario, Canada.

ALEX MCKAY, Ph.D., is Research Coordinator for the Sex Information and Education Council of Canada.

JULIE FRASER, Ph.D., is a postdoctoral Fellow in Social Justice and Sexual Health at the University of Windsor, Ontario, Canada; fraser1@uwindsor.ca

### China:

FANG-FU RUAN. A physician and medical historian, Dr. Fang-fu Ruan taught at the Beijing Medical University until 1985. Editor and major author of *Xingzhishi Shiuce* [*Guide to Sexuality*] (1985) prepared for the People's Republic of China, he has also written *Sex in China: Studies in Sexology in Chinese Culture* (1991). He has also published on sex education, transsexualism, sexual repression, and gender orientations in China in professional journals. A visiting professor at several American universities, Dr. Ruan is chairperson of the department of Oriental Studies at the Institute for the Advanced Study of Human Sexuality in San Francisco, and professor and Dean of Instruction at the Academy of Chinese Culture and Health Sciences in Oakland, California. P.O. Box 70571, Oakland, CA 94612-0571 USA; or 1130 3rd Ave., Apt 903; Oakland, CA 94606 USA; ruanff@yahoo.com

M. P. LAU, M.D. A psychiatrist, Dr. Lau lived in Hong Kong for 30 years before moving to Canada, where he has lived for the past three decades while maintaining close ties with colleagues in China. She is one of the four authors of *Sexual Behaviour in Britain: The National Survey of Attitudes and Lifestyles* (1994). (Section 5 on Interpersonal Heterosexual Adult Behavior.) AIDS Public Education in Europe, London School of Hygiene and Tropical Medicine, Keppel Street, London WC1E 7HT UK.

STEPHEN WHITTLE, Ph.D., M.A., L.L.B., is a lecturer in law at the School of Law, Manchester Metropolitan University, where he specializes in issues of gender, sex, sexuality, and the law. Vice-president of Press for Change, he coauthored Section 7 on gender diversity. School of Law, Manchester Metropolitan University, Hathersage Rd., Manchester M13 0JA UK.

### The United States of America:

DAVID L. WEIS, Ph.D., coeditor, is currently a professor of human development and family studies at Bowling Green State University in Ohio. A member of and officer for the National Council on Family Relations, the Society for the Scientific Study of Sexuality, and the International Network on Personal Relationships, he also served as an associate editor for the *Journal of Sex Research*. Weis has published numerous research articles in professional journals in such areas as adolescent sexuality, marital exclusivity, marital and sexual belief systems, sexual interaction processes, peer education programming, and has conducted workshops in these areas, as well as in interpersonal communications, intimacy, flirtation behavior, dual-career marriages, and black families. Weis received the Hugo Beigel Award for Outstanding Sexuality Research for his study of the emotional reactions to first intercourse. (Introduction; Section 1, Basic Sexological Premises; and Section 5, Interpersonal Heterosexual Behaviors.) Bowling Green State University, Family and Consumer Science, Bowling Green, OH 43403-0001 USA; weis@bgnet.bgsu.edu

PATRICIA BARTHALOW KOCH, Ph.D., coeditor of the United States of America chapter, is an associate professor of biobehavioral health and health education at Pennsylvania State University. She earned a master's degree in the Program in Human Sexuality, Marriage, and Family Life Education at New York University and studied in Japan and Sweden. Her doctorate is in health education from Pennsylvania State University, specializing in sexuality education, sexual health issues, human development, and counseling. She has many publications, including a textbook, *Exploring Our Sexuality: An Interactive Text* (Kendall/Hunt). (Section 3, Sexuality Knowledge and Education; and Section 9, Contraception and Abortion.) Pennsylvania State University, 304 East Henderson Bldg., University Park, PA 16802 USA; p34@psu.edu

### Biographical Sketches: Section Authors/Updaters:

Most of the following contributors are active members of the Society for the Scientific Study of Sexuality, and several have held national or regional offices in the Society.

DIANE E. BAKER is completing her doctoral dissertation on child sexual abuse in the Psychology Department at Syracuse University, Syracuse, New York. (Section 8A, Incest and Child Sexual Abuse.)

SUSAN BARGAINNIER, Ed.D., is an assistant professor at the State University of New York in Oswego, specializing in wellness promotion. (A Door to the Future: Sexuality on the Information Superhighway.)

MARK O. BIGLER, Ph.D., is a lifelong member of the Church of Jesus Christ of the Latter-Day Saints, a graduate of New York University's doctoral program in human sexuality, and director of community education programs at the Utah AIDS Foundation. (Section 2A, Sexuality and the Church of Jesus Christ of the Latter-Day Saints.)

WALTER BOCKTING, Ph.D., an Assistant Professor at the Program in Human Sexuality, Department of Family Practice and Community Health, University of Minnesota Medical School, he is editor of *Masturbation as a Means of Achieving Sexual Health* (2003). (Section 4B, Autoeroticism.)

PEGGY CLARKE, M.P.H., is former president of the American Social Health Association and former assistant commissioner for AIDS Program Services of the New York City Department of Health. She currently teaches health education at Fashion Institute of Technology (State University of New York) in Manhattan. (Section 10A, HPV and Cervical Cancer)

SARAH C. CONKLIN, Ph.D., earned an M.A. degree in guidance and counseling from the University of St. Thomas, an M.A. in theology from United Theological Seminary of the Twin Cities (Minneapolis-St. Paul), and a Ph.D. in human sexuality education from the University of Pennsylvania. She is currently an assistant professor of health and sexuality education at the University of Wyoming (Laramie). (Section 12, Clergy Education.)

AL COOPER, Ph.D., director of the San Jose Marital and Sexuality Centre, edited the first professional book on *Sex and the Internet: A Guidebook for Clinicians* (Brunner-Routledge, 2003). [alcooper@myinternetcity.com](mailto:alcooper@myinternetcity.com). (Online Sexual Activity.)

MARTHA CORNOG, M.A., M.S. (See listing above for Associate Editors.) (Section 4, Autoeroticism, and Section 12, Sexuality Research and Advanced Education.)

RICHARD CROSS, M.D., pioneered medical school sexuality education while he was a professor at the Robert Wood Johnson School of Medicine at Rutgers University, New Brunswick, NJ. (Section 12E, Medical School Education.)

SUSAN DUDLEY, Ph.D., has been involved with reproductive issues throughout her career: from basic physiological research on reproduction, to an NIH-sponsored faculty appointment in the Department of Obstetrics and Gynecology at Pennsylvania State University Medical School, and as Deputy Director at the National Abortion Federation (NAF) from 1998 to 2003. (Section 9C, Abortion.)

WARREN FARRELL, Ph.D., the author of *Why Men Are the Way They Are*, *The Myth of Male Power*, and *Women Can't Hear What Men Don't Say*, has taught at the School of Medicine at the University of California in San Diego, as well as in psychology, women's studies, sociology, and political science. He is a former Board Member of N.O.W. in NYC, an American Board of Sexology Certified Sex Therapist, and frequent keynoter at sexuality conferences. [www.warrenfarrell.com](http://www.warrenfarrell.com); [warren@warrenfarrell.com](mailto:warren@warrenfarrell.com) (Section 2B, Emerging Men's Perspectives on Sexuality.)

MARILYN A. FITHIAN, Ph.D., is cofounder of the Center for Marital and Sexual Studies, Long Beach, California, and coauthor of *Treatment of Sexual Dysfunction, Any Man Can*, and other works. (Section 12, Sexual Dysfunctions and Therapies.)

JAMES R. FLECKENSTEIN is President and CEO of the Institute for 21st Century Relationships, a charitable education and research organization dedicated to fostering and supporting complete freedom of relationship choice among consenting adults. (Section 5C, Polyamory.)

JEANNIE FORREST, M.Ed., worked for seven years as a family educator with the Church of the Latter-Day Saints and was married to a Mormon. She earned an M.Ed. degree

in health education in the Human Sexuality Program at New York University. (Section 2A, Sexuality and the Church of Jesus Christ of the Latter-Day Saints.)

ANDREW D. FORSYTH is a fourth-year graduate student in clinical psychology in the Department of Psychology at Syracuse University whose interests include the assessment of high-risk sexual behaviors among at-risk groups. (Section 10: HIV/AIDS.)

ROBERT T. FRANCOEUR, Ph.D. (See listing under Editors.) (Sections 2, Religious Values, 4, Autoerotic Behavior, 5, Sexuality and Older Persons, 8, Sexual Harassment, Prostitution, and Pornography, 10, STDs, 12, Research Assessment, and Conclusion: "Call to Action.")

BARBARA GARRIS, M.A., earned a bachelor's degree in anthropology and sociology at Mountclair State University and did graduate studies at New York University in women's studies. She worked for AT&T. (Legal Challenges to Free Speech on the Internet.)

PATRICIA GOODSON, Ph.D. After a master's degree in philosophy of education from the Pontificia Universidade Catolica de Campinas, Brazil, and an M.A. in general theological studies (Covenant Theological Seminary, St. Louis, MO), she completed her doctorate in health education at the University of Texas (Austin). She is currently an assistant professor in health at the University of Texas (San Antonio). (Section 12: Clergy Education.)

ERICA GOODSTONE, Ph.D., received her doctorate in human sexuality, marriage, and family living at New York University. Former Science and Research Chair and board member (U.S. Association for Body Psychotherapy), Chair and Professor/Health & Physical Education (FIT/SUNY), Dr. Goodstone is a certified sex therapist, licensed and board-certified marriage and family therapist, and massage and bodywork therapist. [DrErica@sexualreawakening.com](mailto:DrErica@sexualreawakening.com). (Section 11C, Holistic and Touch Therapies.)

KAREN ALLYN GORDON, M.P.H., Ph.D. (cand.), a researcher, teacher, and administrator in public health and health education for over 25 years in nonprofit and university health settings, focuses her work on sexuality education, personal health promotion, substance-use prevention, implementation of U.S. national health objectives, and teacher training. She currently teaches at Fashion Institute of Technology/SUNY and the College of New Jersey. (Section 10A, STDs.)

ERIC GRIFFIN-SHELLEY, Ph.D., a licensed psychologist in private practice (Lafayette Hill, PA), specializes in sexual addiction treatment. He has authored *Sex and Love: Addiction Treatment and Recovery* (1991) and edited *Adolescent Sex and Love Addicts* (1994). [Ericgs1@aol.com](mailto:Ericgs1@aol.com). (Online Sexual Activity.)

WILLIAM E. HARTMAN, Ph.D., recently deceased, was cofounder of the Center for Marital and Sexual Studies, Long Beach, California, and coauthor of *Treatment of Sexual Dysfunction, Any Man Can*, and other works. (Section 12, Sexual Dysfunctions and Therapies.)

ROBERT W. HATFIELD, Ph.D., is an adjunct professor of psychology at the University of Cincinnati (Ohio) and associate director of the university's Psychological Services Center. A board-certified sexual counselor and therapist, Dr. Hatfield is particularly interested in the therapeutic effects of touch (somatosensory stimulation). (Section 11, Sexual Dysfunction)

ROBERT HAWKINS, Ph.D., former associate dean of the School of Allied Health Professions at the Health Sciences Center of the State University of New York at Stony Brook, is also coauthor of *Counseling Lesbian Women and Gay Men: A Life-Issues Approach*. (Section 6, Homosexual and Lesbian Issues.)

LINDA L. HENDRIXSON, Ph.D., focused her doctoral dissertation for the human sexuality program at New York University on issues of HIV-positive women in rural northwestern New Jersey. She has taught at various New Jersey and Pennsylvania universities and published on issues related to sexuality and health education. (Section 10B, Emerging Issues in HIV/AIDS)

BARRIE J. HIGHBY, Ph.D., is a clinical psychologist in the U.S. Air Force at the Ramstein Air Force Base in Germany. She completed her Ph.D. in Psychology at the University of Kansas in 2001. Her research was on perceptions of the causes and prevention of rape. (Section 8A, Sexual Coercion and Rape.)

LORAIN HUTCHINS, Ph.D., a sexologist and sex coach in Washington, DC, she has researched contemporary forms of sacred sexualities in the U.S., and coedited the groundbreaking anthology *Bi Any Other Name: Bisexual People Speak Out*. Her latest research, a book on *Harlots and Healers*, examines the emerging professions of sex coaching, sacred intimacy, and sexological bodywork. lorainhutchins@starpower.net (Section 2A, Spirituality and Sexuality Movements.)

MICHAEL HYDE, M.F.A., Ph.D. (cand.), is completing doctoral work at New York University and has conducted social research concerning the intersection of gay identity and public aesthetics. His dissertation examines the prescriptive use of literature during the last century as a moralizing agent in American education and homosexual culture. He teaches writing, short fiction, and gay and lesbian literature at Fashion Institute of Technology/SUNY in Manhattan. (Gay and Lesbian Literature)

ARIADNE (ARI) KANE, Ed.D., is a nationally known gender specialist, author, and educator, as well as a diplomat of the American Board of Sexology. (Section 7, Gender Diversity and Transgender Issues.)

SHARON KING, M.S.Ed., graduated from the Human Sexuality Program at the University of Pennsylvania where she completed all but her dissertation for the doctorate. Her specialty is survivor therapy. (Section 8A, Child Sexual Abuse and Incest.)

JOHN MONEY, Ph.D., is professor emeritus of pediatrics and of medical psychology at the Johns Hopkins School of Medicine. Among the many national and international honors he has received are the Harry Benjamin Distinguished Scholar Award, the Masters and Johnson Award, and a special award from the National Institute of Child Health and Human Development on the occasion of its 25th anniversary. Author of numerous seminal and pioneering works on gender and psychosexual development, his major works include: *The Adam Principle: Genes, Genitals, Hormones, & Gender*; *The Principles of Developmental Sexology*; *Vandalized Lovemaps*; *Venus Penuses*; *Gay, Straight and Inbetween*; *Lovemaps*; and *The Destroying Angel*. (Epilogue.)

ROBERT MORGAN LAWRENCE, D.C., is on the Board of Advisors of San Francisco Sex Information. He lectures extensively about sexuality and health. (Section 6B, Bisexuality.)

BRENDA LOVE is author of the *Encyclopedia of Unusual Sex* and has worked at the Institute for the Advanced Study of Human Sexuality in San Francisco. (Section 8D, Paraphilic Behaviors.)

CHARLENE L. MUEHLENHARD, Ph.D., is an associate professor of psychology and women's studies at the University of Kansas. Her research focuses on rape and other forms of sexual coercion, as well as on communication and miscommunication about sex. (Section 8A, Sexual Coercion and Rape.)

RAYMOND J. NOONAN, Ph.D. (See listing under Editors and the chapter on Outer Space and Antarctica.) (Sections 1C, Sex and Terrorism, 2B, Heterophobia, 8A, Clergy Sexual Abuse, and False Accusations of Sexual Harassment and Rape, 10B, Impact of AIDS on Our Perception of Sex, 11E, Sex Surrogates, 12A, Gender Differences in Sex Research, Sex in American Popular Culture and in Music Lyrics, and Conclusion: "Call to Action.")

MIGUEL A. PERÉZ, Ph.D., teaches kinesiology at the Fresno campus of the California State University, where he also pursues an interest in sexuality. (Section 2B, Latino Sexuality.)

TIMOTHY PERPER, Ph.D. (See listing under Associate Editors, and Preface.) (Section 2A, Religious Values and Sexuality.)

HELDA L. PINZÓN-PERÉZ, Ph.D., is a Colombian-born nurse with wide experience in public health. A professor at Pennsylvania State University, her research interest include Latino/a health issues, community health, and Latino/a adolescent health. (Section 2B, Latino Sexuality.)

WILLIAM E. PRENDERGAST, Ph.D., a clinical psychologist at the New Jersey State, Adult Diagnostic and Treatment Center for sex offenders for 30 years, is the author of the *Merry-Go-Round of Sexual Abuse: Identifying and Treating Survivors, Sexual Abuse of Children and Adolescents, and Treating Sex Offenders in Correctional Institutions and Outpatient Clinics*. (Section 8A, Clergy Sexual Abuse.)

CAROL QUEEN has written extensively on bisexuality and other topics related to sexual diversity, including *Exhibitionism for the Shy: Show Off, Dress Up, and Talk Hot* (1995). She is a cultural sexologist in the doctorate program at the Institute for Advanced Study of Human Sexuality. (Section 6B, Bisexuality.)

Duenzelbach 10, 82272 Moorenweis, Germany. jmpastoetter@compuserve.de

#### *Acknowledgments from Robert T. Francoeur, Editor*

First and foremost, I must acknowledge the crucial role of the 280 colleagues who were so convinced of the importance of this project that they took time in their busy professional lives to write on the 62 countries and places that are now in this volume. I thank each one of them for their generous dedication, the time and energy they gave to this "labor of love."

In 1995, Jack Heidenry, a dear friend of 40 some years, stepped in with an invitation to publish the first three volumes with Continuum International the same week my initial publisher refused to publish a multivolume *Encyclopedia*.

In 1996, Dr. Ray Noonan stepped into his labor with *IES* at a critical time in our early production when we needed a copyeditor and graphic design person knowledgeable in sexology. His invaluable services merited promotion to as-

sociate editor for *IES-4*, and as editor for the present volume. *CCIES* would not be if not for his calm, unflappable, and methodical creativity and skills in editing, design, and typography.

Another friend and colleague, Dr. Eli Coleman, director of the Program in Human Sexuality at the University of Minnesota Medical School, must be mentioned. Around 1995, Eli, Kittiwut Jod Taywaditep, and Pacharin Dumronggittigule produced a fascinating insider/outsider picture of sexuality in Thailand for *IES-3*. Just before *IES 1-3* went to the printer, Eli, then Secretary General of the World Association for Sexology, diplomatically facilitated WAS endorsement of *IES* as "an important and significant contribution to our understanding and appreciation of the rich diversity of human sexual attitudes, values, and behavior around the world."

The addition of several new associate editors made the challenge of creating *CCIES* a good bit smoother, so I must thank them: Luciane Raibin for her patient work as my communications bridge with our Latino and Portuguese contributors; Beldina Opiyo-Omolo, a native of Kenya and graduate student in public health administration at Stroudsburg State University, for her research and communications with a half-dozen African nations; Jakob Pastoetter, whom I met at the Kinsey Institute in time to prepare an *IES-4* chapter on Vietnam, who then joined *CCIES* as an associate editor. In the last months before publication of *CCIES*, Jakob managed to recruit a dozen enthusiastic experts to write chapters on Botswana, Denmark, Bulgaria, and Switzerland.

Time and time again, Martha Cornog and Timothy Perper, associate editors for information resources, drew on their many years of varied editorial and library experience to advise me on major content and editorial decisions. They always came through just when I needed them most.

Evander Lomke, our Senior Editor at Continuum for *IES-4* and *CCIES*, could not have been more supportive and helpful in guiding us through the intricacies of creating and publishing what started as a 400-page single volume dealing with 20 countries and ended as a unique sexological reference and resource.

Finally, we are pleased to thank UNAIDS HIV/AIDS Information and Data, [www.UNAIDS.org](http://www.UNAIDS.org), for granting permission to reprint their brief country-by-country Assessment of Epidemiological Situation. The assessments provided in this volume were current as of January 1, 2003, and the latest available at press time. Readers of *CCIES* are referred to the regularly updated assessments and complete information available on the Internet at [www.UNAIDS.org](http://www.UNAIDS.org).

# An International Directory of Sexological Organizations, Associations, and Institutes By Region and by Country

*Compiled by Robert T. Francoeur, Ph.D.*

Information for this International Directory was compiled from a variety of resources. Our primary resource was, of course, the authors of Section 12 in the 62 countries and places of *The Continuum Complete International Encyclopedia of Sexuality*. In addition, the Editor is happy to acknowledge the generous cooperation of Smita Palmar, at the Sexuality Information and Education Council of the U.S. (SIECUS), Mac Edwards, editor of the *SIECUS Report*, Dr. Eli Coleman, past president of the World Association of Sexology (WAS), and Howard Ruppel, Jr., Chancellor and Academic Dean of the Institute for the Advanced Study of Human Sexuality (San Francisco).

This directory covers close to 300 regional and national sexological organizations in 70 countries.

## *Regional Sexological Organizations*

### **AFRICAN REGION:**

#### **Center for African Family Studies**

P.O. Box 60054  
Nairobi, Kenya  
Tel.: 254-2/448618-20

#### **International Planned Parenthood Federation (IPPF)– Africa Region**

P.O. Box 30234  
Nairobi, Kenya  
Tel.: 254-2/720280; Fax: 254-2/726596

#### **International Planned Parenthood Federation (IPPF)– Sub-Region for Central & West Africa**

B.P. 4101, Lome, Togo  
Tel.: 228/210716; Fax: 228/215140

#### **United Nations Family Planning Association (UNFPA)– South Africa**

Construction House, Fifth Floor  
110 Takawira St., P.O. Box 4775  
Harare, Zimbabwe  
Tel.: 263-4/738793; Fax: 263-4/738792

### **ASIAN, SOUTH PACIFIC, and AUSTRALIAN REGION:**

#### **Asian Federation for Sexology (AFS)**

Dr. M.L. Ng, Chairman, Department of Psychiatry  
University of Hong Kong, Queen Mary Hospital  
Pokfulam Road, Hong Kong  
Tel.: 852/855-4486; Fax: 852/855-1345  
Email: HRMCNML@hkucc.hku.hk

#### **European-Asian Association of Sexologists (EAAS)**

P.O. Box 274  
Kiev, 252034 Ukraine  
Tel.: 380-44/446-1346; Fax: 380-44/228-0103

#### **International Planned Parenthood Federation (IPPF)– East and Southeast Asia Office**

246 Jalan Ampang  
50450 Kuala Lumpur, Malaysia  
Tel.: 60-3/456-6122; Fax: 60-3/456-6386

#### **United Nations Family Planning Association (UNFPA)– East and Southeast Asia Region Office**

Population Education Clearinghouse  
United Nations Building  
Rajdamnern Avenue  
Bangkok 10200 Thailand  
Tel.: 66-2/391-0577; Fax: 66-2/391-0866

#### **United Nations Family Planning Association (UNFPA)– South Pacific Region**

G.P.O. Box 14500  
Suva, Fiji  
Tel.: 679/31-2865; Fax: 679/30-4877

#### **United Nations Family Planning Association (UNFPA)– East and Southeast Asia Region Office**

Population Education Clearing House  
United Nations Building  
Rajdamnern Ave.  
Bangkok 10200 Thailand  
Tel.: 66-2/391-0577; Fax: 66-2/391-0866

### **EUROPE and the MIDDLE EAST REGION**

#### **European Federation of Sexology (EFS)**

Universitaire Maurice Clalumeau  
55 Boulevard de la Cluse  
CH-1205 Geneva, Switzerland  
Tel.: 41-22/347-3031; Fax: 41-22/320-9286

#### **European-Asian Association of Sexologists (EAAS)**

P.O. Box 274  
Kiev, 252034 Ukraine  
Tel.: 380-44/446-1346; Fax: 380-44/228-0103

#### **International Planned Parenthood Federation (IPPF)–Arab World Region**

2 Place Virgile  
Norte Dame  
1082 Tunis, Tunisia  
Tel.: 216-1/894-173; Fax: 216-1/789-934

#### **United Nations Family Planning Association (UNFPA)–Arab States and Europe**

P.O. Box 830824  
Amman 11183 Jordan  
Tel.: 962-6/817040; Fax: 962-6/816580

#### **World Health Organization (WHO)–European Region**

Scherfigsvej 8, DK-2100  
Copenhagen, Denmark 10130  
Tel.: 45/39-171717; Fax: 45/39-171818  
Email: postmaster@who.dk; Web: www.who.dk

### **WESTERN HEMISPHERE— the AMERICAS:**

#### **International Planned Parenthood Federation– Western Hemisphere Region (IPPF/WHR)**

(Latin and South America, including the Caribbean)  
902 Broadway, Tenth Floor  
New York, NY 10010 USA  
Tel.: 212/995-8800; Fax: 212/995-8853  
Email: info@ippf.org; Web: www.ippf.org

### *Sexological Organizations: Alphabetical by Country*

#### **ARGENTINA**

#### **Asociacion Argentina de Sexologia y Educacion Sexual (AASES)**

Cuba 2243-9°A  
Buenos Aires, 1428 Argentina

# Index

This index is designed to help the reader quickly locate parallel discussions of specific topics in the 62 countries and places contained in this *Continuum Complete International Encyclopedia of Sexuality*. With this Index, the reader can compare an issue, such as “sexuality education” or “contraception,” in five-dozen countries. It also guides the reader to issues and topics that are peculiar to certain cultures or countries. Sexual harassment, for instance, is a major issue in European and North American countries, but is hardly or not at all recognized in some South American, African, Eastern European, and Asian societies. Similarly, female circumcision, woman-woman, arranged, and levirate marriages are issues in a few countries, but not in others. Although this Index is a handy guide to all major issues, it is not comprehensive because of the obvious human limitations of the Editors and equally obvious limitations of space. This Index can be used in conjunction with the outline of the main topics provided on the first page of all chapters. A familiarity with the detailed content outline given in the section, “Using This Encyclopedia,” in the front of this book, will also help the reader pursue specific information, since all chapters are structured on this detailed outline.
