

Scale 1: 175 000 000

THE WORLD CLOCK: The earth is a globe which rotates and spins on its axis, and the sun and stars appear to revolve around it from east to west, because the earth is rotating from west to east. In twenty four hours the earth makes a complete rotation on its axis. The velocity of the earth's rotation is 360° in twenty four hours, or 15° in one hour, or 1° in four minutes. A clock is simply a machine to indicate the speed of the earth's rotation and inform us of the subdivisions of time. We see at a glance that at any place on the meridian 15° east of Greenwich the clock is one hour later than at Greenwich, because the sun has risen one hour earlier, and at any place 15° west of Greenwich the clock is an hour earlier, because the sun is an hour later in rising.

*The 180° longitude is taken as the **International Date Line** where one calendar day ends and another begins. While crossing from east to west one gains a day and loses the same while travelling from west to east. The line is not straight in order to avoid the landmasses which would be divided in terms of time and add to the complexity of time zones.*

Standard Time** is the time kept on land. Countries may adopt a uniform or multiple time zones keeping in mind the extent of its boundaries longitudinally. Many countries also vary their time seasonally on account of the varying amount of daylight throughout the year. Such seasonal changes as '**Daylight Saving Time**' is not shown on this map. Standard Time is measured in relation to the zero time zone, which is centered on the Greenwich or the Prime Meridian. The time in this zone is known as the **Greenwich Mean Time** or **Universal Time.
